> I have been offered a 2nd hand copy of Lattice C version 5.
>Unfortunately the registration card has been sent in. Does
>anybody know what Lattice' policy is regarding transfer of
>registration (for updates and such)?

I would have thought that a written transfer of rights from the previous licensee to the new one could be sent to Hisoft or their appointed agent for changing the registration details. The person who originally sent in the registration card will then be unable to claim any support because he is no longer registered. It didn't ought to cost anything, did it?

>same company (or so I am led to believe from the conflicting press reports t
>which I've had access.)

Well, from speaking with the editor and publisher of ANALOG/STlog, LFP, Inc. was reluctant to put the kind of money into the publication that it would tak to really promote it, given the ill health of the Atari marketplace (and that was then... things have gotten steadily worse since..). Their Videogames magazine was given plenty of support and is thriving today in the Nintendo/ Sega/NEC world. I don't recall specifically whether they said if STlog was still making money when it was folded, but just taking a look at the last issue demonstrates that they were in trouble. Much of the ad space was ANALOG ads.. the actual number of advertisers was very small.. a very bad sign.

Reports on CompuServe from Paul LeFevre of Antic indicate that STart had been losing money steadily for months. The decision was finally made to halt production and avoid any further losses. Again, taking a look at the last issue, much of the advertising was from ANTIC itself, and you can't pay the bills with free ads.

ST User and ST Format are nice, but have little to do with MY world, here in the U.S. It's frustrating to read about products I either can't even buy, or which have no local support, assuming I can find them. I've run up some nice phone bills calling MirrorSoft in England because there is no local support for their Atari products. Seeing their new programs in English magazines does me little good at all.

>be a path for CD Rom applications?

I don't use Gemini, but I do know what CDPATH is, from using ksh and
bash. The CDPATH variable contains a list of directories to scan for
a directory name given to the 'cd' command. For example, if my CDPATH
is ":/usr:/usr/entropy:/usr/bob/pub/bin/bsd4.3/recreation" then
if I type "cd games" the shell will:

1) cd to ./games if it exists (some shells don't do this if you have a CDPATH)
2) otherwise, cd to /usr/games if it exists
3) otherwise, cd to /usr/entropy/games if it exists
4) otherwise, cd to /usr/bob/pub/bin/bsd4.3/recreation/games if it exists

CDPATH is very useful if you have long paths to very common storage
areas and don't like typing them all the time.

6. Hard disk booting

Newsgroup: comp.sys.atari.st
Date: 1991-06-01 10:31:24 UTC
From: seran@VMS.HUJI.AC.IL
Message-ID: <1JUN91133124@vms.huji.ac.il>
Source record: 231603

Hi,
Please tell me if this is a good idea or are there better ones.
Recently I , in a very tired and uncarring state, put a program in my boot
drive c: of my hardisk. It was an ACC. When I rebooted the program caused
the computer to totaly crash. I am using desk manager so I was not too worried
and went into the ACC selection and unmarked this program. But it did not help.
The ACC still ran and still crashed the computer. After many hours of working
and trying to get rid of the program or around it in some way, I gave in to the
thought that I will have to reformat my hard drive. The next day I came up with
a simple, obvious idea which saved me. I only formatted drive c:. Then I put
in C: as a boot drive again and reloaded from my back-up which was almost fully
entact.

I avoided losing all 60 megs but I also came up with a diff idea. Why not
partion the HD so that drive c: is the smallest amount of memory possible.
make it a boot up drive and stick _only_ desk manager there. Then make a drive
d: or whatever that will contain all the prg's and acc's that desk manager acceses.
Then if ever I get a program which kills on booting I can just format drive c:
and only need to restore desk manager. It sounds good to me, perhaps I am
wrong. Any ideas, suggestions, or comments would be appreciated.

Also, what is the procedure of putting dos on the hardisk for pcditto? And
is there also a way to do the same for aladin?

Thanks,
Eran..
(please answer to my email adress bellow if possible as I cannot read the list
often)

7. Personal Pascal 2

Newsgroup: comp.sys.atari.st
Date: 1991-06-01 13:35:22 UTC
From: larserio@IFI.UIO.NO
Message-ID: <CMM.0.90.2.675783322.larserio@kvart.ifi.uio.no>
Source record: 231573

```
Personal Pascal 2 Question
""""""""""""""""""""""""""
I just read that HiSoft is going to drop Personal Pascal 2 and as
a true Personal Pascal lover I wondered about some things that I
think someone out on the net migth help with:

When I bought Personal Pascal 2 i got it with these program versions:

Gem shell 2.02 (the newest version of the whole package
Compiler 2.0 is 2.05 and I desperatly need this !!!!)
Linker 2.02

However - There is a bug i the Compiler that messes up something
with the GEM system. After x number of compilations everything
locks up. Even if I run the compiler only once som programs go
bananas afterward if I try to run them. If I run the compiler
without GEM (as a TOS program) this does not happend....

Is there anyone out there who knows WHERE I can get the NEWEST
versions of the GEM SHELL, the COMPILER and the LINKER. I know
there is a newer version of the compiler and I simply MUST have it.

I could ask HiSoft, but I won't switch to their new Pascal (to many
programs to convert and to expensive to buy a whole new system..)

Any help would be great !!!!

>>
>>> You're seeing effects of the death of the Atari marketplace in the US.

Sick != dead. Atari US is still selling every machine they can get, with no obvious sign that that's going to change. I sure don't know what software all those machines are running, but there are pretty good numbers of them. Sick I'll agree with readily: clearly, too sick to support a glossy magazine devoted only to Atari computers. Sick implies 'might die', but it leaves open the possibility 'might recover', too. I'll list some hopeful signs.

1)Atari Corp. has finally cleared away the wreckage of the Federated disaster.
2)The applications which look like the next corporate fads, DTP and combining sound with animations (desktop multimedia) are better supported on Atari hardware than the old fad applications (graphic spreadsheets and professional wordprocessing) were.
3)The game machine segment doesn't seem to have any nasty surprises left.
4)Portfolio looks like a nice steady money generator, but its market niche has become cut-throat enough that Atari is unlikely to put excessive (from an ST fan's viewpoint) effort into follow-ons.
5)There's finally a commercial development system for the TT (Lattice).

You pays your money and acts accordingly. I know that a little fella has to be nuts to try to crack the PC software market today. Mac is tough too, but maybe possible. ST and Amiga are still at the stage where a good idea (software or hardware) could be pushed with a limited budget, and have a chance of making a profit. The biggest successes may go on to try other markets; at least the foundation will be in place.

>THIS MESSAGE CREATED ON A TT. Now, if only the software base would
>expand (yeah, I know I can run Macware, after all I use GCR!!!!!).

This message is also being posted from a TT. My TT manual also stated that
I have a 68882, but Mac software says I have a 68881. Has anyone else
seen this? My machine came with TOS 3.01. I purchased it just 3 weeks
ago. I wish I knew why Atari is shipping machines with down rev TOS
and the wrong math co-processor. On a positive note, I love the new
desktop. I'm the legal owner of both DC Desktop and NeoDesk. Gribnif
lost me as a customer when they wanted more for the upgrade to 3.0 than
I could buy it mail order. I prefer the TT desktop.

The TT is fast and Mac/Spectre is even faster. (much Mac software uses
the 68881) I am very happy with the purchase. Both local stores are
sold out of TT and waiting for more from Atari. (B&C and SJC)

>CDPATH is very useful if you have long paths to very common storage
>areas and don't like typing them all the time.
>

This point has become sort of interesting. If you read
exactly what I said, it was a sort of a trick comment. Truth
is, I was being sarcastic. I did realize that they were using
it to define a search path for an empty 'cd' call. Truth is,
also that I really haven't seen CDPATH used personally (though
apparently it's 'csh' as well as 'ksh'. What I was getting
at though is that it's not classic Unix standard because 'sh'
simply looks for HOME. Though I'm starting to wonder now if
some versions of 'sh' might have been re-written to go either
way. But I was getting at a couple of points, albeit in retrospect,
in an overly cleverly manner. First, it's simply unnecessary.
If you think about the purpose of HOME and the purpose of CDPATH,
they are essentially duplcations of each other. Second, as I
pointed out earlier in my message, the Gemini team doesn't seem
to understand what HOME is for, and if they did, they would have
realized the unnecessary duplication. And I was hoping that
it would become clear, in a Zen sort of way that unnecessary
clutter in the environment is to be avoided. And also, as
I said in my earlier posting, if you don't get your standard uses
properly organized, you end up writing applications that look
in the wrong places for things. For example, if you have one

fellow using CDPATH and HOME for different purposes arbitrarily
and someone else somewhere else using them differently, you
could wind up with 2 applications that conflict. Like if
1 is looking for a '.signature' file in your HOME directory
which is '/usr/grp1/user1' but CDPATH is 'usr/projects/contract1'.
After all, if you have both then why not use them? Now if you're
going to *look* like you're copying Unix usages, then you better
be careful that you get some idea what standard usages really
are. And that may go beyond the manuals.

And I guess in this case I suggest that people simply
define CDPATH=${HOME} unless they have a really good reason not
to do so. And thinking about it, the best definition for the
CONSOLDIR (I think that's what it was called) is simply "." rather
than whatever they did (I think they set the console directory to
the GEMINI directory or something like that).

But it was really sloppy of me. I rarely post things
so deliberately obscure, and frankly I just plain botched it.

If I recall, CDPATH is the path that mupfel will search when you type "CD directory". It's sort of like Norton CD under DOS - you can type "CD directory" without a partition letter and CD will look on the various paths specified by CDPATH for that directory name, regardless of which drive it is on.

No, do not do this. All programs that import .IMG images
should at least use these values to calculate the aspect ratio of the
picture. Our product, Wordflair II uses them if they seem reasonable to
display images correctly when the preserve aspect-ratio option is selected.

If you do not have any information about the original pixel size put in
something like 72dpi x 72dpi.

> No matter how you feel about the Amiga/Atari/Mac wars,
>the IMG "standard" just isn't sufficiently defined and has not real
>underlying rational.

You are probably right, but .IMG is the only format currently supported
by the GEM functions in the ATARI. So it will be around for quite some time
more. We should try to get all programs that support .IMG's to use them
cosistent, this would take care of at least some the problems that we are
having with .IMG's.

There is a program called mcvert for unix that will convert .hqx files to
mac binarys. Once you are there you need some utility that will convert
the Mac fonts to GDOS format.

The .sit files are created by StuffIt!, the Mac equivalent to arc files. The
details for StuffIt! files are available, but I do not know of any
implementations on the ATARI. You might have to "unStuff" them on a
PC or a Mac.

Yeah I have seen the Sega "Gamegear." (Strange name..!) It looks alright, but the Lynx does indeed have better graphics. IN my latest Sega magazine (the thing sega sends free to its consumers) they showed graphics to some other GG games and the graphics weren't too hot.. The Lynx does have better graphics!!

But who cares about portables? I'm home most of the time! And when I"m not at home I'm driving, so when would I want to play? Hehe.. Yeah I know people buy portables to play at home but... Not me.

I WANT A 16 BIT NINTENDO!! ICK!!

(Do we have to wait until August? Yes I know this belongs in r.g.v... :()

Regarding the twitterpater (sp?) filelist:

col_drac.? Is DRACHEN, color version. Drachen is a "shanghai" clone. You Which is another name for Mah Jonng (I know I flubbed that.). You eliminate tiles from the screen by pairing like tiles together. The objective is to eliminate all the tiles from the screen.

I really loved the original Drachen. It worked in monochrome and was very nice! Sharp, crisp graphics. But I don't like using my mono since it is on the top shelf and I need to crank my head up about 20 degrees. Needless to say I was very happy to discover col_drac is identical to the mono Drachen, only in colobRfEjdg

.... in effect, GET IT! great game.

20. Moniterm 19" Monitor For Sale: Reduced!

I have a 1040ST with the Atari SH204 hard disk drive.
The cable that came with it is about 1.5 feet long,
and this *severely* limits where I can put the drive
relative to the system/keyboard.
Is it possible to get a longer cable???
Will a longer cable work? (i.e. is the protocol length-sensitive?)
If so, is there a part number I should look for,
and where could I buy this cable?

Many thanks,

22. BPB woes...

Newsgroup: comp.sys.atari.st
Date: 1991-06-02 02:50:15 UTC
From: 4171ay@gmuvax.gmu.edu
Message-ID: <1991Jun1.215015.51385@gmuvax.gmu.edu>
Source record: 231596

Hey there out in UseNetLand... Having a bit of trouble with my
SH204 and was wondering if anyone had encountered the same problem, and
more importantly, come up with a fix. My problem is that my D: partition
either doesn't have a BPB (Bios Parameter Block) or the one it has is
corrupted... I have reformatted the HD *TWICE* and still no luck so
apparently HDX v3.01 doesn't reset the BPB. I have 3 partitions on
the unit. C is 10 meg, D is 5, and E is 5. IF I try moving a file onto
D: I get TOS error 34 and the message "Path not found". A few of the
programs I have check each drive online before executing and when they hit
D: they give "Error reading BPB" messages so I am almost POSITIVE that
this is where the problem lies. Partitions C and E work fine.
Any suggestions, hints, clues, pointers to programs that would fix this,
etc would be GREATLY appreciated...

> end of the week. Has anybody finished testing this thing?

The *VISIBLE* files may ammount to 40K, but the actual data on the disk may be far greater. I don't have an STe, so I can't check for sure. Have you ever bought a game and looked at the directory just to see what is there? Often, there is nothing, yet the game is still there. I don't know why things are like this, but they sometimes are. If a file is MSA'd, like the demo you mentioned, then it is a good indication that there is more to the demo than meets the eye. Many demo's do this. I suppose it is a form of protection. After all, would you want people to steal the stuff you worked so hard to create?

26. Booting STEs and TTs

Newsgroup: comp.sys.atari.st
Date: 1991-06-02 09:27:23 UTC
From: andre@cix.compulink.co.uk
Message-ID: <1991Jun02.092723.26231@demon.co.uk>
Source record: 231606

The correct boot process for both STEs and TTs is firstly to have a floppy in the disk drive! It should be formatted, but it needn't contain anything. This avoids about 10-15 seconds delay while the drive is checked for a bootable floppy disk. (If you are paranoid about virii, write protect it)

Now turn on, and after the hard disk is up to speed simply press the spacebar and the computer will boot straight up. This keypress bypasses the built-in delay which waits for HD speed (which is far longer than any HD mechanism I've ever come across).

After this, any warm boots (i.e. reset or Control-Alt-Delete) will *not* wait for HD speed (as it's already running), but they will still check for a floppy disk, so leave that in place.

Hope this helps,

Andre

You read it right. They are now selling High Speed pascal, a product from
Denmark. This is introduced as compatible to Turbo Pascal 5.0 on the PC. Like
Turbo Pascal it allows compilation to memory as well as to disk. Compilation
speed is rated at about 20,000 lines per minute. The product comes with quite a
few precompiled units that allow easy porting of Turbo Pascal programs from the
PC to the ST platform. The price in UK for Version 1.1 is 99 pounds sterling
(most likely to include VAT, value added tax at 17.5%). There is a special
upgrade deal for the Personal Pascal users. Contact Hisoft or their dealer for
deatils.
All the above information are from Hisoft's brochure and I am no way connected
to Hisoft.

>Any help would be great !!!!

Your mac software is wrong I think, but anyway I wrote a program (SYSINFO)
that will give information about the configuration of your system,
I posted it to c.b.a.s two months ago, unfortunately that version did it
wrong, but you can still use it to look which FPU you have
look at the cookiejar info at the cookie _FPU if it has value 0x00020000
you have the 68882.
A new version of sysinfo will be posted to c.b.a.s very soon, this one will
use FPU instruction to tell the difference between 68881 and 68882

Hi,
I'm having trouble with my Vortex ATonce Plus emulator. It all seems to work except for the fact that I keep losing characters when I try to use the serial port (this is even at 1200baud).

Can anybody offer me any assistance here oor does the ATonce Plus just not handle the serial port very well?

Thanks,
Paul

The .com would indicate an IBM PC compatible executable. For the Atari
ST, you want an external 1200 or 2400 baud Hayes compatible modem. As for
software, I would recommend Flash 1.6 (available via mail order for about
$15) as is it very easy to use. Later, if you want more extensive terminal
emulation, you can obtain Uniterm 2.0e free from the net or PD disk house.
Again, I would recommend Flash for a beginner.

I need some recommendations for a UUCP program which will allow me
to use my Mega 2 to connect with another site to transfer mail and news.

I have tried Rodney's UUCP modules version 1.18. Although the two
machines successfully connected I got a message that the host expected
a window size of 7 and a data size of 64. Then the connection terminated.

Is there a simple fix for this or is there some other program available I
can use?

Please folks, include as much info as you can. For instance,
just an 800 phone number is not enough,
if, for instance, in come cases, you live in the same state,
or if, for instance, you live outside the USA.

I've seen a program somewhere that lets a ST unpack a SIT file - not
sure what it's called, but the best place to look would be atari.archive...

40. TT

Newsgroup: comp.sys.atari.st
Date: 1991-06-03 06:01:01 UTC
From: chuj@horton.colorado.edu
Message-ID: <1991Jun3.060101.6359@colorado.edu>
Source record: 231621

I am about to see on a purchase of a TT from a friend who knows
another friend which is selling the machine. I think he mention of
around the price of $1000.00 without a monitor. I of course could
not believe the price was that low, but if it is I'm taking it!
I needed to know some info before asking of it.

1) The TT is it a 32-BIT architecture?

2) Any expansion slots? (how many and what are they 8/16/32?)

3) MUTI-TASKING MACHINE RIGHT?

4) How many address registers 32?

5) What is the maximum memory addressable.

6) LAST question is ASSEMBLY develop for the TT available?

I would ask some of these questions to the seller, but it would seem the
seller would not know of these things otherwise he would probably sell
it for more than what I was told. And to Steve what type of DEMOS should
I look for to run on the TT? (It would seem that I have chosen the TT if
that price is what it is).

Thanks in ADVANCE
Jeff

> be a path for CD Rom applications?
> --
CDPATH is not for CD Rom applications, it is very handy if you are
using several disk partitions. You can tell gemini where to look
for a directory name when you do a 'cd Directory'. It's also very
handy when you are using a lot of directories.

For example, if you are using the partitions C..F and you have
a directory called 'UTILITY' and is located on drive E:,
CD looks for the directory 'UTILITY' on drive E: only if you have
specified drive E: in CDPATH (CDPATH=C:\;D:\;E:\;F:\).
When you are for example in the directory 'C:\EDITOR\WORDPLUS\DOCS'
and you do a cd UTILITY, gemini will succeed in finding it.
When GEMINI finds it, it also prints the full path of the
directory. Hope you now know where CDPATH is use for.

Geert.

>

I have that kit, too. Or rather: I _had_ it. I disconnected it,
because since it was installed, I had some troubles with the disk.

When the disk was used for more than four hours the day before,
it wouldn't start up again. I nedd to shake the entire disk quite
roughly to get it rotating again. I know some day this will have
disastrous effects...

I blame the fan thermostate for this problem. Unfortunately, although
I disconnected it, I have still this startup problem.
I wouldnt recommend a fan thermostate.

>I think you will find it is not a illegal copy, its a demo
>version, NEOchrome Version 0.5

It's not version 0.5 that is on the ST User disk.
It's a disassembled/decompiled version 1.0 that has been improved, rebuilt and called version 2.10 by a hacking group called Chaos.

That's illegal because version 1.0 is not PD and so is taking a copyrighted program apart.

Now if NEOchrome was made completely PD by Atari then I guess there would be no problem.

>How about Claus' driver (CBHD) - cost, language, etc...

I won't comment on my own driver, just on its availability. Currently,
it's only available as part of my book, and the book is written in German.
There are three options if you want to use my driver:
- you can read German --> get the book
- you can't read German, but we somehow finally find a good translator
and distributor for the US and UK --> maybe there will be an English version
- there will be a stand-alone version of the driver later this year (hopefully)

As I said before, I won't comment on whether it is worth waiting for my driver.
Enough advertising for today.\

Actually, the word from Bob Brodie at Atari is that it's nothing more than
an illegal modification of the original neochrome. Thus, you won't find
it here.

I'm trying to view a couple of demos from the archives at umich, and
am having some problems - they seem to load fine, but
the screen starts 'rolling' immediately - I assume I need to put my system
in 50Hz mode, but the following 'fixes' also from the archives ALSO make the
screen roll (before the demos load): hertz.arc, swaphz.arc, 50hzboot.prg

I've got a Mega 4 running U.S. TOS 1.4. Any suggestions?

>
>A friend of mine told me that his Unix workstation has a 1.2Gb hd and it is
>just about enough... But it has it's own nntp package and mail handler.

The information I have (from a UK magazine) is:

Standard Unix-TT : TT030/8-210 (i.e. 8Mb RAM,210Mb hard disk) with
Unix 5.4, X-Windows (can't remember version no),
OSF/Motif, GNU package, TTM-194 19" monitor.
Price = $4000 US

Network Unix-TT : As above but with Ethernet among other comms stuff (not
detailed)
Price = $4500 US

Unix Upgrade : Unix, X-Windows, OSF/Motif, GNU stuff installed
on 210Mb hard disk.
Price = $1600 US
-This is the one I'm interested in as I currently have a TT030-8/40

One interesting piece of software from a company called X-Software
(or something like that) was said to allow GEM programs to run within an
X-Windows window... adds the very nice feature of not needing to reboot or
come out of Unix to run standard ST/TT software.

I'm pretty sure the prices I give were the ones quoted (magazine
is at home, not here!) but I'll check and post the correct prices if I've
got them wrong...

Just out of interest has anybody seen any TT-specific programs out
there which really make use of the beast's power ? I've heard about a new
art package which handles TT-low and TT-high screen resolutions but that's
about it.

Thank you. I put a lot of effort into the user interface.

MS-DOS uses exactly the same technique to identify an executable boot sector as the ST. Well, actually, it's the other way around. GEMDOS was built to MS-DOS compatibility in that way. An MS-DOS executable boot sector will be identified by Vkiller as "executable", but as unrecognized. It would be extremely complex to attempt to look at the code in the boot sector, and attempt to determine if it were MS-DOS code or ST code.

The vast majority of MS-DOS viruses, now, are of the link type, which infect files, rather than the boot sector. ST versions of these link viruses are now appearing in Europe infecting ST files. They will be appearing on this side of the Atlantic soon, I expect. I have revieved data on a couple of the ones captured in Europe, and am working on tools for the ST to combat them.

55. ATARI TT030 versus AT 386/33 MHz and 64KB Cache

Newsgroup: comp.sys.atari.st
Date: 1991-06-03 12:48:24 UTC
From: rdjeline@faui09.informatik.uni-erlangen.de
Message-ID: <rdjeline.675953304@faui09>
Source record: 231632

Hi all there !

I own an TT030/4 and I was very interested in the position of this
machine in the computer-scene. A very good chance to find out, was
the best friend's purchase of an AT (see above). He got the
machine in pieces as an dealer for the price of 4200 DM.
That's what the MESS-DOS has:
* 1024 x 768 / 256 colors VGA
* 120 MB AT-Bus HD
* 386/33Mhz & 64 KB Cache
* 4 MEG of RAM
* DOS 4.x

The technical Data of an TT should be known in this Group.

OK here is the final truth:

SUBJECT: TT-DATA: AT-DATA:
Drystones 4885/7865(TT-Ram) 9811
Whetstones (no test-Programm) 170.1

Let's make an Stop here and look at this: The Drystone-Programm
that we did run on the TT was written for the ST and did not use
the special 68030 commands. The MESS-DOS has no FPU, so that
point should be no problem.

The next tests were little GFA-BASIC(!!) Programms.
On the TT 3.6(TT) was used.
On the AT 4.3(MS-DOS).

First Programm: (all programms were run uncompiled.
compiled all values would be factor 2 to 5 perhaps even more
faster ...)
1 Million INT-ADDS 20/12 sec.(TT-Ram) 5.1 sec !!
10.000 TANGENS 0.805 sec 9.4 sec
10.000 SINUS 0.667 sec 5.8 sec

GEM-Graphics (VDI)TT has NVDI 12 sec 27 sec
GEM-Graphics (AES) 3 sec 8 sec

From the TANGENS computing to the AES test you can divide
the time by 1.6 if you
wish to know the TT-time in the Fast-Ram.

After 3 hours of testing and heavily exchanging opinions about the
machines (he HAS 120 MB HD <-> i HAVE 512 KB ROM and better Sound)
and so on, we stopped and played Eye of the Beholder on his AT.

At 2 o'clock in the morning, when he went home, we decided, that both Machines are very very good (I think my is a little little bit better).

By the way: we did the same test one year ago with the ST and an 10/12 Mhz 286. The result was the same. (The AT had AdLib Sound).

That's all !!

All TT-Users are welcome and I hope some want to contact me.

56. What about comp.sys.atari.tt ????

|>
|> "Wake up to find out that you are the eyes of the world."

The Blitter is a kind of coprocessor for graphics. If you move a window on
the screen or a dialog box will be drawn, then you must transfer a bit of
memory from on memory location to another. This on can faster be done from
the Blitter than from the 68000. The name stands for BitBlt chip. In the
ST is a Line-A Routine called BitBlt. If you switch on the Blitter entry in the
desktop, then this routine programms the Blitter. If you don't set that switch
the routine will emulate the function of the Blitter in software.

Was the ACC set for Read Only ?? this could be one of your Problems.
Also it would have been very easy to Delete the ACC from the Directory
with a sector editor..there is a good PD, but Mono one thats called
Monomone.

Sorry, but that's wrong. CDPATH defines a list(!) of directories where
Gemini should search for the directory given as argument in the cd
command. It's something similar to the PATH variable, which gives a list
of directories where Gemini should search for the given command. I'll show
you an example, perhaps you'll understand it more easily:
Imagine you have a folder structure like this:
c:\btx\
c:\btx\macros\texts\
c:\btx\macros\grphics\
c:\btx\pages\german\
c:\btx\pages\englisch\
c:\fido\
c:\fido\out\
c:\fido\in\
Now suppose you are currently working in d:\fido\out and want to change
into c:\btx\macros\texts\ to examine a text. Normally, you'd have to type
in the full path in order to get there. If you are using CDPATH, you can set:
setenv CDPATH='.,c:\,c:\btx\,c:\btx\macros\,c:\btx\pages\,c:\fido\,d:\' etc.
Now all you've got to type is "cd texts" and gemini will cd to
c:\btx\macros\texts. Got it? This is very powerful tool, you'll save a lot
of work, especially if you would normally be forced to use long paths...
The list in searched from left to right, so it's a good idea to put the '.'
in first place. Thereby Gemini will search in the current directory first.
/s/
PS: Are You using the english or the german version of Gemini? Take a look
at mupfel.doc, they explained the reason for CDPATH quite good.

>some versions of 'sh' might have been re-written to go either

And BaSH, by the way...

>way. But I was getting at a couple of points, albeit in retrospect,
>in an overly cleverly manner. First, it's simply unnecessary.
>If you think about the purpose of HOME and the purpose of CDPATH,
>they are essentially duplcations of each other. Second, as I

Wrong. $HOME is the home directory of the user. As long there is no multi-user GEMDOS, there really is no need for soemthing like that on the Atari.

$CDPATH however is a _list_ of paths, used only for `cd'. And, finally: why don't you take a look in other shells like BaSH, which also have $HOME and $CDPATH. Why don't you send your sarcastic comments to Brian Fox. Why didn't you send constructive comments????

>pointed out earlier in my message, the Gemini team doesn't seem
>to understand what HOME is for, and if they did, they would have
>realized the unnecessary duplication. And I was hoping that
>it would become clear, in a Zen sort of way that unnecessary

>going to *look* like you're copying Unix usages, then you better

>be careful that you get some idea what standard usages really
>are. And that may go beyond the manuals.

Again: $HOME points to a directory, $CDPATH is similar to $PATH -- it's a
list of paths. How _could_ they both be used for the same purpose?

62. More than 4 Meg ??

Newsgroup: comp.sys.atari.st
Date: 1991-06-03 18:14:43 UTC
From: SYSPMZT@gecrdvm1.crd.ge.com
Message-ID: <91154.141443SYSPMZT@GECRDVM1.BITNET>
Source record: 231642

The implication I've heard is that I can only address 4 Meg with my 1040 STe. I've already upgraded to that point with 4 1-Meg SIMMS, and am wondering if, should memory prices drop in the future, I'll be able to expand with 4 2-Meg or 4 4-Meg SIMMS.

Is there an architectural restriction limiting a 1040 STe to addressing 4 Meg, and if so, what is that restriction? Also, can anyone explain if and why I must add symetric amounts of memory in the SIMM slots? (eg 4 1-Meg, not 1 1-Meg and 3 256K, etc.)

Thanks,
Phil Z

Message-ID: <5930@ac2.maus.de>
Source record: 231478

Hi Jim,

JO>Also, I have no idea what they are intending to use the "CDPATH"
JO>for. I've never seen it on a Unix system or an OS-9 system and
JO>I don't know what program would look for it. Is that supposed to
JO>be a path for CD Rom applications?

... the environment variable CDPATH is a Mupfel-feature, I think.
It is used to define where a "CD" (change dir) command - used in the
shell - should preferably look first.
Just a short look into the documentation ... (please excuse my
translation ;-))

cd [dir]
Changes to directory dir. Without arguments the value of
$HOME will be used. Dir may contain a drive specification
(eg. C:\BIN). If there is an CDPATH defined and a change
to dir is not possible, then Mupfel puts dir
at the end of each CDPATH-entry and tries to change
directory at this path.

example: cd TEST
path TEST not found
CDPATH defined as C:\FIRST, D:\SECOND
now Mupfel tries to make a
cd C:\FIRST\TEST
and cd D:\SECON\TEST
before issuing an 'dir not found' error

Kind regards
Lutz

>said, but that the other 6MB of ram comes from using the VME bus for ram
>expansion. In fact, the VME ram is supposed to be faster than STram (no
>sharing it with video, etc.), even though it is slower than TT ram.

No, no, no... Your picture of memory in a TT and its limits is a little
off.

On the motherboard there are two megabytes of ST RAM. Period. No options,
no extra SIMM or DIP sockets, no nothing.

You can buy a 2MB ST RAM add-on card, for a total of 4MB of ST RAM. There
may one day be an 8MB ST RAM add-on card, resulting in a total of 10MB
of ST RAM.

You can buy a 4MB TT RAM add-on card. It may be that, with some work, you
can make this address 16MB of TT RAM. In future (now?) you can buy 16MB of
TT RAM from Atari -- I'm just not sure.

All of these boards are more than just RAM -- they also have memory
controllers which you can't just get off the shelf.

In the TT030, there is one VME slot, but it is not appropriate to put
system expansion RAM there. The slot is for peripherals, not RAM. If you
DO put RAM there, you have to tell the OS about it yourself, and it will be
slow: it's not cacheable, it's only 16 bits wide, it's on the VME bus, and
it's not SCSI-accessible (meaning transfers have to be use SCSI-accessible
RAM; this is taken care of in the drivers, but it slows you down). I've
put memory there to test things, and it is not fun. Things run
DRAMATICALLY slower from that kind of RAM.

It is not unreasonable to suppose that Atari may, in future, come out with
a machine in the TT family which has full-featured VME, including the
ability to put 32-bit, cacheable, OS-detectable, SCSI-accessible RAM on the
VME bus. The TT is designed with this in mind, but the actual VME bus in
the TT030 isn't capable of it. Such RAM would be slower than TT RAM
(mainly because you can't do burst fills on the VME bus) and about the same
speed as ST RAM: faster because it's not shared with video, but slower
because it's on the VME bus.

>Is it possible to get a longer cable???
>Will a longer cable work? (i.e. is the protocol length-sensitive?)

The DMA cable has to be short. Atari once accidentally shipped drives with a 3' cable, and all hell broke loose. Some third parties ship thier drives with long cables, too, but you use those at your peril. About 2' is all you get with any reliability. If those 6" mean a lot to you, ask a dealer.

73. Future Directions

Newsgroup: comp.sys.atari.st
Date: 1991-06-03 23:10:41 UTC
From: chu@acsu.buffalo.edu
Message-ID: <78763@eerie.acsu.Buffalo.EDU>
Source record: 231646

Hi,

Currently, I own an unexpanded 520STfm with a total of 2 720K drives
and believe it or not, for the moment anyways, it serves my needs
fairly well.

However, I'm thinking about the future and the possibility of
outgrowing this machine (which has, allowing for some "trade-ins" from
Atari, done everything I've needed it to do for the past 5 or 6
years) in the next few years.

I will probably be doing much more "numerically intensive" computing
work and some program development in the future as well TeXing reports
and the like (which of course, right now I'm not doing on my 512K ST)
along with the other "normal" applications.

Anyway, the question is this:

Should I save up to expand the memory up to 4 Megs, get a large hard
disk and maybe replace the 8MHz 68000 with something else

or is outgrowing this machine inevitable and I should save up for
something else (perhaps a TT or some other sexy sounding UN*X box)?
(In other words, by if I upgrade my ST, am I going to find myself
having to abondon it anyway?)

I know that I'm being difficult because I haven't been every specific
about my situation. The only thing I'm sure about at this point is
that I'm probably going to need more than my ST, as it currently
stands, can deliver.

Please reply by E-mail only!!!

I do not want to start some sort of flame war, but I would like the
advice of people who have perhaps already gone through this.

So, please reply by E-mail only!!!

If anyone is interested in the responses, write to me and I'll come up
with a summary to mail back.

Thanks...

john

Spend some time driving around downtown Windsor, Ontario in a van with Dave Small and other Atari developers... talk a little with Charles F. Johnson. Find out how close most developers are to losing everything they've sweated and bled to build up. Talk with magazine publishers and editors who can't pay their contributors because their advertisers are either out of business or can't afford to pay their advertising bills. Talk with dealers who have either gone out of business, losing most of their investments in the Atari market, or who have been forced to go on into other markets. Talk with current Atari dealers who can't get products to sell, so they can stay in business.

Europe may be a different story, but in the U.S.A, Atari=dead.

Hopeful signs 1-5 = too little, too late.

I'm sorry, I don't like it either

I was checking with Dave Small yesterday through the Gadgets RT on Genie. He says it doesn't run yet. Not even the installer. But being the genius he is, coupled with the fact that he has managed to get every other system to work on GCR, he should figure it out soon. He says he will be possibly posting an interim software upgrade. System 7 needs at least a 2 meg Mac Plus to run. The system uses a minimum of 1 meg for itself. That's the BARE minimum.

Source record: 231390

Spend some time driving around downtown Windsor, Ontario in a van with Dave Small and other Atari developers... talk a little with Charles F. Johnson. Find out how close most developers are to losing everything they've sweated and bled to build up. Talk with magazine publishers and editors who can't pay their contributors because their advertisers are either out of business or can't afford to pay their advertising bills. Talk with dealers who have either gone out of business, losing most of their investments in the Atari market, or who have been forced to go on into other markets. Talk with current Atari dealers who can't get products to sell, so they can stay in business.

Europe may be a different story, but in the U.S.A, Atari=dead.

Hopeful signs 1-5 = too little, too late.

I'm sorry, I don't like it either

>* Finland * fax +358 0 8735916 * s37837k@saha.hut.fi * sausage! *

I had a question for all the hardware gurus who know whats what about
the TT - like Alan Pratt, etc. I know that the TT uses a daughter-board
to use the TT "fast" memory, and that this board has chips that allow access
of up to 16MB of memory. What I was wondering is, is this 16MB limit a limit
due to the daughter-board, a limit of the TT, or just a limit of the TOS?
For instance, would it be possible for a third party company (if Atari does't
do it themselves) to manufacture a daughter-board that accesses more than
the present 16MB?

-Mike

PS: Is the unix/TT the same hardware with the new software, or are there any
hardware changes? New card slots? New ROMs (I had heard they couldn't run
ST software _and_ run the Unix software)?

I wouldn't be so quick to blame the kit on this problem. I see SO many
disks come in where I work that have this problem, where the spindle sticks.
It happens on low capacity drives (especialy 3 1/2" drives like the ST125(N))
a lot. No one has been able to tell me how to fix this problem (if it is
fixable), but I have found that by manually rotating the spindle frees it up
a lot safer than shaking it.

Hi,

I intend to add better support for the Atari STe in MINIX, but I
only do have a plain ST. So I was wondering if anyone could
mail me the differences between these. I'm only interested in
hardware differences, and especially in new device registers and how
they are used. Does someone have this info??

Thanks,

Ok. Since Claus is too polite to promote his own software.

If you can read German, be sure to get the book and the software.
It is definitely worth every pfennig. If you want a good
set of disk utilities, and you do know something about disks,
you might also get the book, just for the software.
I think the software is very, very good. You won't really need
the book to use the software, but it explains several things
in some more detail. A good buy for around $ 50,-- (if you
can find it of course).
And you fathers out there. Remember that it is almost fathers day!

By the way: I'm by no means connected to Claus or the book publisher.
I'm just a very very satisfied customer.

That's more the opinion of Chaos than fact. The say send the money to Dave Staugas and put or left an Atari copyright on the program. None of this was done with Atari's consent and so is illegal. BUT if Atari would like to say something on NEOchromes future themselves I would be interested to hear it.

This may not apply, but I had a SH205 hardrive in a Mega ST box. I, too, was
getting pissed off by the loud fan. I open it and noticed that the hand was not bolted to
anything but it just sits into a slot. I then put some blue-tac so
that it will stick to one of the side walls to stop it vibrating against the
surrounding wall or stop it jumping around in its slot. I was quite amaze as to
the amount of noise being removed.
I have not seen the inside of a megafile 30, but I assume that it would be the
same.
The blue-tac material is some stuff that will adhere two piece of material but
with the ability to separate them later.

Last year's online mags indicated how it significantly depleted Atari of monetary reserves and probably checked ST development for a long time. I think the best time to evaluate Atari's prospects will be fall '91/spring '92, when they reveal how the ST line will evolve.

The June '91 AtariUser stated that Atari Israel will hire 600 workers, mostly comprised of engineers. Oy, with 600 engineers, Atari must be developing something!

All the computer companies are struggling thru the recession and Atari seems to be weathering it pretty well. Since becoming downsized, they seem to be more responsive, even with less capital compared to their competitors. I don't know of other top executives participating in online conferences with the public, so it shows Atari is willing to listen. I'm not sure if it would be possible for them to get on an Internet MUD or IRC, but it would be nice.

>why I must add symetric amounts of memory in the SIMM slots? (eg 4 1-Meg, not
>1 1-Meg and 3 256K, etc.)

From the looks of my STe, the extra multiplexed address line from the MMU-GLUE (MLUE) to the SIMMs doesn't exist. However, the MLUE is a 144 pin chip and a logic probe showed that most of the unconnected pins are definitely alive! It was mentioned earlier that Fast Technology supposedly had a 14MB DRAM upgrade for the 1040 STe, but I'm not sure how it obtains signals from the MLUE which has extremely thin surface-mounted pins.

Another puzzle is the shifter, which was enlarged to 84 pins from a 40 pin chip. Besides the increased palette, what are all those extra pins used for??? Also someone posted some info about the SCSI-like Microwire serial bus that the STe has and I hope someone has more docs regarding it.

Source record: 231255

In article <1991May31.192058.10926@nntp.hut.fi> s37837k@saha.hut.fi (Jari Lehto) writes:
>Unix System V Release 4 is available for TT. The package consists of
>TT 030/8 or higher (16 Mb would be quite good), harddisk bigger than
>200Mb (I'm not quite sure of this), X-Windows, TTM 194 19" MC-monitor
>and a big bunch of software and manuals.
>I don't know the exact price, but it is much lower than the NeXT Station,
>and A 3000 & Unix SVR4.
By a little? A lot? Is that only available in Europe/Canada or is that/
will that be available in the US too?
>
>Just checked, the harddisk is 200Mb, and there are also VME Ethernet network
>card, OSF/Motif, and GNU package (with C, C++ etc.).
>
Are there extra card slots? If not, will there be some way of expanding
past
the 20MB limit (16TT + 4ST ram) since the slot would be taken up by the
ethernet card?

>

I had a question for all the hardware gurus who know whats what about
the TT - like Alan Pratt, etc. I know that the TT uses a daughter-board
to use the TT "fast" memory, and that this board has chips that allow access
of up to 16MB of memory. What I was wondering is, is this 16MB limit a
limit
due to the daughter-board, a limit of the TT, or just a limit of the TOS?
For instance, would it be possible for a third party company (if Atari does't
do it themselves) to manufacture a daughter-board that accesses more than
the present 16MB?

-Mike

PS: Is the unix/TT the same hardware with the new software, or are there any
hardware changes? New card slots? New ROMs (I had heard they couldn't run
ST software _and_ run the Unix software)?

102. LOGO

Newsgroup: comp.sys.atari.st
Date: 1991-06-04 10:45:18 UTC
From: Roger.Sheppard@f98.n250.z1.FidoNet.Org
Message-ID: <676362366.6@egsgate.FidoNet.Org>
Source record: 231258

Does any one know if its posible to get Ataries Logo to work with Tos 1.4/1.6
I do get a out of Memory when I try to load a Logo Program/File,
Note: The software does load up on a 1040 ST with Tos 1.4.
Are there any patches to make this work ?

103. Re: More than 4 Meg ??

Newsgroup: comp.sys.atari.st
Date: 1991-06-04 11:26:31 UTC
From: dpg@cs.nott.ac.uk
Message-ID: <1991Jun4.112631.10649@cs.nott.ac.uk>
Source record: 231532

In article <91154.141443SYSPMZT@GECRDVM1.BITNET> SYSPMZT@gecrdvm1.crd.ge.com writes:
>The implication I've heard is that I can only address 4 Meg with my 1040 STe.
>I've already upgraded to that point with 4 1-Meg SIMMS, and am wondering if,
>should memory prices drop in the future, I'll be able to expand with
>4 2-Meg or 4 4-Meg SIMMS.
>
>Is there an architectural restriction limiting a 1040 STe to addressing
>4 Meg, and if so, what is that restriction? Also, can anyone explain if and
>why I must add symetric amounts of memory in the SIMM slots? (eg 4 1-Meg, not
>1 1-Meg and 3 256K, etc.)

The answer to both questions is, I believe, that the MMU in the STe can
only handle .25 and 1 meg SIPPS/SIMMS, and these are arranged in two banks,
which must contain the same amount (hence, memory configurations can only
be .5 meg, 1 meg, 2 meg, 2.5 meg, and 4 meg). I too have a four meg STe.

Perhaps someone out there knows of a replacement MMU and memory slots? (Could
it be that a 68030 board might have this facility?).

Question is, what would you do with more than 4 meg on an ST running TOS (or
MiNT). I've yet to exhaust 4 meg (even with GCC, MGR, and BASH. Emacs coming
soon... :-)

105. Making a HD bootable

Newsgroup: comp.sys.atari.st
Date: 1991-06-04 12:03:48 UTC
From: rfriedel@csd4.csd.uwm.edu
Message-ID: <12756@uwm.edu>
Source record: 231522

I realize that this is a frequently asked question but I have ignored
it till now.

I just bought a Spectre GCR over the net and while attempting to make
one of my partitions on my hard drive a Mac partition, I got the drive
to disappear. Any way to bring it back? Naturally there is some
irreplaceable data in another partition that was not completely
backed up.

Please email. (I have ftp access to atari.archives.umich.edu)

Thanks,
Ron

In this list, games have been rated on a scale of 1 to 10, 10 being the best and 1 being the worst. For each game, the total number of votes, the average rating, and the vote distribution are shown. New games are indicated by a "*" before their entry. If a "(C)" appears after the title it means that the game is a CD-ROM or disc system title. If a "(J)" appears after the title it means that the game is currently only available in Japan.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

The vote distribution uses a single character to represent the
percentage of votes for each ranking. The following character codes can
appear:

"." no votes cast "3" 30-39% of the votes "7" 70-79% of the votes
"0" 1-9% of the votes "4" 40-49% of the votes "8" 80-89% of the votes
"1" 10-19% of the votes "5" 50-59% of the votes "9" 90-99% of the votes
"2" 20-29% of the votes "6" 60-69% of the votes "*" 100% of the votes

Please consult the article entitled "ABOUT THE VIDEO GAME RATINGS REPORT"
in the newsgroup rec.games.video for more details, including information
on how to vote.

>
>1)Atari Corp. has finally cleared away the wreckage of the Federated disaster.

Last year's online mags indicated how it significantly depleted Atari of monetary reserves and probably checked ST development for a long time. I think the best time to evaluate Atari's prospects will be fall '91/spring '92,

when they reveal how the ST line will evolve.

The June '91 AtariUser stated that Atari Israel will hire 600 workers, mostly comprised of engineers. Oy, with 600 engineers, Atari must be developing some-
thing!

All the computer companies are struggling thru the recession and Atari seems to be weathering it pretty well. Since becoming downsized, they seem to be more responsive, even with less capital compared to their competitors. I don't know of other top executives participating in online conferences with the public, so it shows Atari is willing to listen. I'm not sure if it would be possible for them to get on an Internet MUD or IRC, but it would be nice.

109. VIDEO GAME RATINGS BALLOT [ATARI]

Newsgroup: comp.sys.atari.st
Date: 1991-06-04 14:52:51 UTC
From: erc@radon.berkeley.edu
Message-ID: <42308@ucbvax.BERKELEY.EDU>
Source record: 231525
Cross-posted to: rec.games.video,rec.games.misc,comp.sys.atari.st

```
To use this ballot, just hit "R". Once in your editor, insert your game
rating between the word "vote" and the system code and game title. Your
rating must be an integer between 1 and 10. There must be at least one
blank on either side of your rating. Make sure the word vote appears at
the start of each rating.

If you do not want to rate a particular game, just DELETE THAT LINE FROM
THE BALLOT. When you are finished, SAVE THE FILE, and exit the editor.
The votes will be sent to the game rating tabulator.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested
in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

If you want to vote for additional games, just add them at the end, in
a format similar to the existing entries. Be sure to include the system
code right before the title. This code is one of the below:

AL = Atari Lynx AM = Commodore Amiga
GB = Nintendo Game Boy GG = Sega Game Gear
GS = Apple II GS MA = Apple Macintosh
NE = Nintendo NES and Famicom NG = SNK NeoGeo
PC = IBM PC, PS/2, and compatibles SG = Sega Genesis and MegaDrive
SF = Nintendo Super Famicom ST = Atari ST
TG = NEC TurboGrafx-16, TurboExpress,
and PC Engine

Thanks for participating in the rec.games.video ratings poll. (This
text was adapted from Chuck Musciano's rec.arts.movies ballots and John
Leo's rec.games.video ballots.)

Did you ever hear the one about how many Atari engineers it takes to screw in
a light bulb?

111. Reading TOS/DOS formatted disk on a SparcStation

Newsgroup: comp.sys.atari.st
Date: 1991-06-04 15:40:53 UTC
From: M.A.Rahin@lut.ac.uk
Message-ID: <1991Jun04.154053.11570@lut.ac.uk>
Source record: 231466

There must have been some discussions on the above subject. But, as I was not in need, did not keep it then. I need it now, quite desperartely. Could some kind soul please send me detail information (including directions for programs for reading/writing TOS/DOS disks on the SparcStation) directly via e-mail ?

Thanks in advance.

In article <SPA.91May29125415@alfa.fct.unl.pt> spa@fct.unl.pt (Salvador Pinto Abreu) writes:
| ... (using GNU cat from
| cs.uni-sb.de), a lot faster than creating a RAMdisk and using GNU
| Emacs, I'd say...

Thanks to Salvador for directing me to this FTP site. In addition to GNU cat, I found other useful utilities, including a new GNU make version 3.58. My above mentioned problem does *not* happen anymore with this make. I have another problem with this make: it cannot find any of the executables mentioned in my Makefile. Has anyone else this GNU make? Does it use ';' or ',' as PATH separator? Does it require UNIXMODE to be set?

Folks, please don't inundate this FTP site, as their hours are restricted. I'll be uploading to atari.archive a number of the utilities really soon now, once I figure which are recent versions or not. Some have already been posted to USENET.

Cheers,

113. GDOS in general

Newsgroup: comp.sys.atari.st
Date: 1991-06-04 17:28:44 UTC
From: wao@cbnewsm.att.com
Message-ID: <1991Jun4.172844.10673@cbnewsm.att.com>
Source record: 231456

I recently started to use OPUS. I would like to use the charting functions but that requires GDOS. Since OPUS is the only program I run which requires GDOS I am unfamiliar with the beast. I do have a copy of GDOS version 1.1 which was included on a Word Flair demo disk. Anyway, I have GDOS but where do I get screen and printer fonts? Also, is there a good GDOS primer out there somewhere?

Thanks in advance
Bill Oswald

115. Degas -> Gif Format converter?

Newsgroup: comp.sys.atari.st
Date: 1991-06-04 18:35:35 UTC
From: elliottj@tramp.colorado.edu
Message-ID: <1991Jun4.183535.568@colorado.edu>
Source record: 231527

Is there a utility for switching Degas-type picture files into GIF format? I'd like to find such a utility for a friend of mine who has a 1040ST, but I didn't see anything really appropriate on atari.archive.umich.edu. I know that PicSwitch will go from Gif to Degas (or other formats), but I didn't think it went the other way. If someone could mail me with information on where to find such a program, I'd appreciate it.

Jim
elliottj@tramp.colorado.edu

116. Clock Recommendation

Newsgroup: comp.sys.atari.st
Date: 1991-06-04 19:06:05 UTC
From: SYSPMZT@gecrdvm1.crd.ge.com
Message-ID: <91155.150605SYSPMZT@GECRDVM1.BITNET>
Source record: 231535

Can anyone recommend a good clock for a 1040 STe? I once had a cartridge clock that came with a host of desktop utilities. The package didn't work very well, and the clock ran very fast, so I junked it.

Anyone care to share the name/manufacture of a clock that works well?

Thanks,
Phil Z

117. v15INF1: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1991-06-04 19:32:37 UTC
From: koreth@twitterpater.eng.sun.com
Message-ID: <14508@exodus.Eng.Sun.COM>
Source record: 231546
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@twitterpater.eng.sun.com (Steven Grimm)
Posting-number: Volume 15, Info 1
Archive-name: intro

This is the first of three introductory articles about comp.binaries.atari.st.
This one describes how to submit binaries to the newsgroup. A companion
article lists all previously-published binaries, and a third article explains
how to retrieve and unpack binaries posted by others.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
koreth@twitterpater.eng.sun.com

--------------------

Subject: Submitting binaries for publication

Items intended for posting or queries and problem notes should be sent to
atari-binaries@twitterpater.eng.sun.com. If you are on a UUCP-only site, you
can send them to {backbone}!sun!twitterpater.eng!atari-binaries. Note that
comp.binaries.atari.st is not the correct place to ask general questions
or to ask, "Does anyone have software that does X?" Post such requests to
comp.sys.atari.st or comp.sys.atari.st.tech.

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a
program works, and if I can't get it to work, I may hold up posting it
for a couple of days. Please note that, except in rare cases, software
without documentation will not be published. The backlog from receipt
to posting varies from one to four weeks depending mostly on the set
of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two
separately. If I have to separate your sources from your binaries by
hand, your submission will most likely sit on the back burner for a
while.

Please include a description of your program at the top of your article.
Look at old issues of comp.binaries.atari.st for examples of the sorts
of descriptions I'm looking for. I don't write the descriptions at the
tops of the articles; what you see is what the submitters gave me.

Also, as of volume 8, I will only accept binaries packed with an archiver
for which source code is widely available. For the time being, this pretty
```

much means arc, zoo, and lharc. If you want to use a nifty new archiver, make the source code available to the public (posting to comp.sources.atari.st is fine.) I reserve the right to repack binaries with another archiver if the other archiver saves a significant amount of space, or has other advantages.

If you're submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. The net gods become angry when people try to use the net as a free advertising medium, and I'd like to keep comp.binaries.atari.st out of trouble. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. In other words, treat the net like a PBS station (apologies to those outside the US.) I will not accept programs which I feel are excessively commercial. I'm aware that commercial demos and shareware are often very useful (to the users on the net,) which is why I allow them at all.

Subject: The structure of comp.binaries.atari.st articles

Each posting in comp.binaries.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.binaries.atari.st: binaries and "information postings." They can be distinguished by the subject line:

Subject: v15INF2: Index and other info

This first word in the title identifies this as the third info posting of volume six. Similarly, the subject line shown below:

Subject: v15i081: deadwrtr -- Ouija-word processor

identifies this as the 81st binary article in Volume 15. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v15i041: zx81 -- Timex/Sinclair emulator part04/39

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: uuencode, 1meg, medium, high

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

uuencode - program is uuencoded (UNIX uudecode required to unpack)
uue - program is uuencoded (ST uud required to unpack)
arc - program is archived (arc required to unpack)
zoo - program is a zoo archive (zoo required to unpack)
lharc - program is an lharc archive (lharc required to unpack)
high - high resolution

medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: jackt@atari.UUCP (Jack Tramiel)
Posting-number: Volume 15, Issue 80
Archive-name: rsn

The "Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The "Reply-To:" header line in the article's main header points to the submitter, to make commenting about binaries easier.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this program in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do make an effort to keep filenames to 8 characters or smaller, however.

Subject: Reporting and tracking bugs and patches to postings

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in the posting (for instance, a font editor's documentation might refer to some sample fonts), contact the submitter, not me. I post articles in their entirety, so if it isn't posted, I probably don't have it.

118. v15INF2: Index of previously-published binaries

Newsgroup: comp.sys.atari.st
Date: 1991-06-04 19:39:15 UTC
From: koreth@twitterpater.eng.sun.com
Message-ID: <14510@exodus.Eng.Sun.COM>
Source record: 231547
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@twitterpater.eng.sun.com (Steven Grimm)
Posting-number: Volume 15, Info 2
Archive-name: Index

Files listed below can be requested from the Atari archive server,
archive-server@twitterpater.eng.sun.com. Send it a mail message containing
the word "help" for information.

Note: When requesting files from the archive server, replace the last "/" in
a file's path with a space, e.g. volume1/turtle part01. You may request
several files from the same directory (volume1/turtle part01 part02 part03).

HOW TO USE COMP.BINARIES.ATARI.ST

by Steven Grimm

Last update: June 4, 1991

_1. _W_h_a_t _a_r_e _b_i_n_a_r_i_e_s?

Binaries are files that contain information other than normal text. Usually, a binary that is posted to the net will contain executable (program) files. Binaries are distinct from _s_o_u_r_c_e_s, which are the human-readable text files that are interpreted by a computer and used to produce binaries. Sources can be modified with relatively little effort, and are usually pretty easy to read. Binaries are not intended to be viewed by a human.

_1._1. _U_u_e_n_c_o_d_i_n_g

The programs which transfer network news messages (and electronic mail) are not always capable of handling a pure binary file. They are designed to handle textual messages, and the odd symbols and characters in a binary cause them to become confused, and often to mangle the binaries. To avoid this problem, a method called _u_u_e_n_c_o_d_i_n_g is used. Uuencoding translates a binary file into text characters, so that the news and mail transport programs won't mess up. The disadvantages are that uuencoded files are about 30% bigger than the raw binary files they represent, and that you have to go through one extra step to get the binaries to work on your computer.

_1._2. _A_r_c_h_i_v_e_s _o_r "_a_r_c _f_i_l_e_s"

Usually, a program will need more than one file to work properly. The extra files might be data files, help files, or maybe some instructions for the user. In order to easily package multiple files together in one binary file, a program called "arc" (short for "archiver") is used. Arc also compresses all the files as it packages them, so that the arcfile take up less disk space (and takes less time to download!) than it would if its contents were just thrown

together.

To confuse matters even more, two new archive programs called "zoo" and "lharc" can also be used to achieve the same effect. Zoo is superior to arc in some respects, slightly inferior in others, as is lharc. Unfortunately, you can't unpack a zoo archive with arc or lharc, or vice versa (arc and lharc are similarly incompatible with each

other.)

_1._3. _U_S_E_N_E_T _a_r_t_i_c_l_e_s

The USENET has groups designed especially for transmission of binary files. They are usually called something like "comp.binaries.x," where x is the type of machine that the programs will run on. For Atari ST owners, the group to watch is comp.binaries.atari.st. Most of the binaries groups (including the Atari binaries group) are _m_o_d_e_r_a_t_e_d, which means that you can't send a program directly to everyone on the network. Instead, you send it to someone in charge of the group (the _m_o_d_e_r_a_t_o_r), who makes sure that your program works and contains the proper documentation (or that the lack of documentation is announced), and that it's in the correct format to be sent out to the rest of the USENET.

One of the restrictions of the USENET is that articles can only be a certain length. If a binary is longer than that, it must be split up into several parts, each no longer than 45000 bytes or so. This introduces yet another obstacle to people who want to transform the articles into a useful form, but it can't really be helped until the USENET starts running much more advanced news transmission software. Also, some particularly long programs may be posted over the course of several days; otherwise the net would be overloaded with lots of huge messages, and people would complain.

USENET binaries are grouped into _v_o_l_u_m_e_s, each containing about 100 articles. This is to make life easier for people who are trying to keep track of which articles have been posted. When a new volume is started, the moderator will usually post introductory articles, including a list of previously published articles.

_2. _H_o_w _d_o _I _g_e_t _b_i_n_a_r_i_e_s?

There are two ways to get binaries: first, by reading the USENET newsgroup comp.binaries.atari.st; you will see new articles within a week (usually much less) of the time

they were sent out by the moderator. If, for some reason, your site doesn't receive comp.binaries.atari.st, or if you want to look through previously posted articles, site twitterpater.eng.sun.com has all the binaries stored in its archives.

The other way to get binaries is to request them from twitterpater's archive server. The archive server is a program that intercepts incoming mail messages and looks for commands inside them. You can tell it to list the available binaries, give you help, or send whichever files you're interested in. The requested files will be mailed to you.

Using Binaries -3-

One thing to be careful of is that multi-part postings aren't placed in the archives until all their parts have been sent out to the USENET at large. This is to prevent people from requesting all 99 parts of a program the first day it appears, thus overloading the net and defeating the purpose of piece-by-piece posting.

To find out more about the archive server, send a mail message containing the word "help" to archive-server@twitterpater.eng.sun.com. Talk to an administrator at your site if that mail address doesn't work. If you don't get any response from the archive server within a few days, something may be wrong; mail archive-manager@twitterpater.eng.sun.com to report the problem.

There are other archive sites, too, such as terminator.cc.umich.edu; they contain most of the comp.binaries.atari.st software as well as some additional programs that have not appeared on the newsgroup. Some sites, such as terminator, also offer something called "anonymous ftp" if you're on the Internet. Say "ftp terminator.cc.umich.edu", and if you connect, use "anonymous" for a username, and your username for a password. See the ftp documentation at your site for more information. A recent, but possibly incorrect, list of alternate archive sites appears at the end of this article. Please send me mail if you know of any that aren't mentioned here, or if my list is incorrect. Note that twitterpater does not offer anonymous ftp, as it's on a network that's segregated from the Internet.

Twitterpater also offers an "auto-index" service, for people who don't have access to the USENET groups. If you request autoindex service, you will receive copies of the archive-server's index files for the binaries and sources groups whenever new files are added. Note that if your site gets comp.binaries.atari.st, requesting autoindex is point-

less and a waste of net bandwidth. Send mail to autoindex-request@twitterpater.eng.sun.com if you'd like to sign up.

_3. _H_o_w _d_o _I _d_e_c_o_d_e _t_h_e _b_i_n_a_r_i_e_s?

As stated above, turning binaries from USENET articles into a more useful form can be a multi-step process. At the least, you will need the uudecode program; it is standard software on most UNIX|- systems and is available in a couple of forms on the Atari. Versions for other operating systems do exist, and can certainly be written with little effort. Arc is available for UNIX and other operating systems, but is not standard software. In any case, you will want at least arc on your Atari.

_____
|- UNIX is a trademark of Bell Laboratories.

A version of uudecode written in ST BASIC is available in twitterpater's archives (see above). It is in volume 1 of the comp.sources.atari.st directory (note that that's _s_o_u_r_c_e_s and not binaries). Once you have that, you should get the files "arc," "arcdoc," and "uucode" from volume 1 of the binaries directory. They contain the arc program mentioned earlier, its documentation, and a much better, faster version of the uudecode program.

Use the BASIC program to uudecode the two encoded files; then use arc to unpack the better version of uudecode. (Arc is documented in "arcdoc.") Note that if you're reading news/receiving mail on a computer (such as a UNIX system) that already has uudecode, you can skip most of this; you will probably just want to uudecode arc there, then download it (using kermit, xmodem, or your favorite transfer protocol - consult your site's administrator and your Atari communication package's documentation for more information. Remember to use binary mode when downloading arc files!)

So far, everything has been small enough to fit in one piece, but you will almost certainly want to try something larger eventually. The Atari "uud" program (whose source code, also suitable for compilation on UNIX systems, is available in the sources archive) is capable of easily decoding multi-part uuencoded files. Near the top of each part (except the first) will be a line like

begin part c foobar.uac

Rename each file (except part 1, which can be named "part01" or just about anything else) to the name at the end of this "begin" line, in this case "foobar.uac". Then run

uud on the file containing part 1; it contains instructions to cause uud to look for the other parts. If you have a text editor or a UNIX style cat program, you can just stick all the parts together in order and run uud on the resulting (big) file; it will try to go on in the first file if it can't find the next part in a separate file. Note that uud won't warn you if it's overwriting an existing file, so don't give any of the parts the same name as the file that's being extracted from them!

On UNIX systems, you can also say (for instance) "cat part* | uud -" without renaming anything.

If you don't have uud or would prefer to decode your binaries on your larger news computer, the procedure is somewhat more complex. Plain vanilla uudecode doesn't know about multi-part uuencoded files, so you have to fool it into thinking that everything is in one part. First, stick all the parts together (using cat on UNIX). Edit the

resulting file. Now remove all the extraneous lines of text in between the parts -- this includes mail headers, any text, lines of the form "include foobar.uad," "table" lines and the lists of characters following them, and "begin" lines other than the one at the beginning of part 1. Once you have converted all the parts into a big uuencoded mass (with no blank lines!), the regular uudecode program will work.

Obviously, this is something of a hassle, and the recommended procedure is to try to install uud on your large computer. You'll usually want to minimize the amount of data you have to send to your Atari, since you'll most likely be downloading it at a relatively low speed, and the uudecoded .arc file is the smallest thing you can download.

Zoo is available from the archives. It is simple to use; refer to the documentation included in zoobin.arc (yes, you need to use arc to extract zoo!) for more information. The uudecoding process is the same for zoo and arc files. Lharc is also available.

Most archives contain documentation; refer to the instructions in a specific program for usage information and the like. If you have problems with a particular program, send mail to the submitter (listed near the top of each part.) The moderator doesn't have time to become very familiar with all the programs that are posted, so the submitter will probably be much more helpful.

_4. _L_i_s_t _o_f _a_r_c_h_i_v_e _s_i_t_e_s

Note: I have not verified these, so this list may be
wrong. Mail servers usually respond to the word "help"
alone in a mail message. Some of the sites listed below may
not contain full archives of comp.binaries.atari.st, and
some may have other files.

Message-ID: <676362150.53@egsgate.FidoNet.Org>
Source record: 231256

I recently started to use OPUS. I would like to use the charting functions but that requires GDOS. Since OPUS is the only program I run which requires GDOS I am unfamiliar with the beast. I do have a copy of GDOS version 1.1 which was included on a Word Flair demo disk. Anyway, I have GDOS but where do I get screen and printer fonts? Also, is there a good GDOS primer out there somewhere?

Thanks in advance
Bill Oswald

Some more things for sale:

1) SF314, very little used, $75
2) Specter GCR, not quite working, last time I check, it will boot magic format fine, but cannot read mac disk. You may get it fixed easily, I don't know. No mac rom, $60, sold as is.

123. Current Notes/Dave Small query

Newsgroup: comp.sys.atari.st
Date: 1991-06-04 23:15:59 UTC
From: wilmott@utopia.rutgers.edu
Message-ID: <Jun.4.19.15.50.1991.2146@utopia.rutgers.edu>
Source record: 231548
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I was just reading through the latest issue of Current Notes, specifically the article by Dave Small. I thought it was a very good article; very daring of him to write it, and it definitely made me stop and think about the topic...

Anyway, my quick question for those of you who have read the article and might [think they] know the answer - what company, and which early 80's 8-bit programmers was Dave talking about specifically? I have been around the Atari community for 10 years, so I probably will recognize the names, but I can't think of who they might be offhand.

Please limit any replies to this message to e-mail rather than posting...I do not wish to stir up a lot of muck within the newsgroups. Thanks.

-Ray

I remember hearing that START magazine had published information on how to make disks formatted on the ST (?) so that they can be read on IBM compatibles as well as the ST. This was supposed to be done by altering three bytes somewhere on the disk. Do any of the readers know of this information? I tried looking back through what issues I have of START but couldn't find the info and am afraid that it is in an issue I have not bought.

What sectors/bytes have to be changed?

128. 'only_ste.lzh'

Newsgroup: comp.sys.atari.st
Date: 1991-06-05 02:34:38 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1991Jun5.023438.220@lsuc.on.ca>
Source record: 231543

Well, today I finally got a chance to try out this demo kit.
Having verified the file I uploaded it to a local BBS in its original
form. I thought about adding a documentation file, but changed
my mind. It needs one, but frankly I was just too tired at the time.

The music is indeed *very* good. So is the overall finish of the
package. The only thing I don't like about that is the concept of the
packaging as an autobooting disk in an MSA file.

But I'm a bit worried about the comments I've been hearing
about this demo. I don't want to sound overly negative about this,
but with all the enthusiasm of the postings, I'm wondering if
somebody might end up showing this around expecting to impress
some heavy duty "stereo nut", or a really hip musician who has
a few thousand tied up in Yamaha and Roland, or even some of
the other brands of computers. Don't think you're going to impress
an Amiga owner or even an old Apple II owner who has a good music
card -- say, 1982 vintage. 8 bit resolution is 8 bit resolution and
though this demo is really good, it's not going to "blow [anybody]
away" who is really experienced in the field. It shows aliasing at
times and even clipping, and the dynamic range is generally flat.
That's not the fault of the programmers. It's simply the limits of
the hardware showing themselves.

Guys, it's *really good*! In fact, it may well be the best we'll
ever see on the STE as it now stands and indeed it's about as good
as anything I've heard on the Amigas and Tandy MS-DOS boxes. But
it's not better. . . .

So we have to hope, that ATARI Europe could go on with it's line, even
if ATARI USA has broke down. When looking at the facts, you would believe,
that Europe's division could sell ST's even if the mothercompany has gone.
But could the mother permit this to it's child. Looking backwards I see,
that ATARI Europe always had to ask the US division to do anything new,
isn't it ?

^^^^^^^

Nope. TOS 1.6 has a screwed up memory sizer that assumes that if two banks of
RAM exist then both banks are the same size. I don't know if this is a bug
in the true sense or malicious crippling but it is sad.

BTW, a bank is two SIMMs since memory access is on a word basis.

512K = 2 x 256K SIMMs
1Mb = 4 x 256K SIMMs
2Mb = 2 x 1Mb SIMMs
2.5Mb = 2 x 1Mb SIMMs + 2 x 256K SIMMs (Not with TOS 1.6)
4Mb = 4 x 1Mb SIMMs

The Rainbow TOS release notes say:-
"Here is the procedure which will return the address of the variable
_run (what I described) no matter what ROM you have ..."

So Atari US are being rather inconsistant here.
I think Atari might mean that it should only be used as a process ID and the fact that it is the basepage pointer should not be relied on.

A long time ago with my 1040 St and my SH204 I had the same problem of having a new ACC completely crash my system. Unfortunately at that time, I did not have some sort of boot manager to rename ACCs and AUTO programs. I booted the machine and waited a few seconds while it charged the AUTO folder. I then quickly turned off the hard disk and then back on again. GEM came up without my normal ACCs loaded. I deleted the offending file. Of course, I do *not* recommend to anyone to do this technique!! Furthermore, I found better: boot off a floppy that contains AHDI.PRG. Then one just opens up C: and fixes whatever one wants.

Cheers,

Take a look in the printing/pbm directory at atari.archive: the pbm-bin.zoo file contains a zillion programs to convert from graphics format A to format B. PIx and GIF are mentioned, so there should be a path between them.

>I do get a out of Memory when I try to load a Logo Program/File,
>Note: The software does load up on a 1040 ST with Tos 1.4.
>Are there any patches to make this work?

I posted this question on GEnie about a year ago when I got TOS 1.4 put in my 1040ST. One of the ST wizards (one of the CodeHeads or one of the Double-Click boys, I don't remember for sure) came up with the answer:

****
* Trick LOGO by loading a RAM disk first (such as SI_RAM which is an *
* accessory), then load LOGO, then remove the RAM disk. The memory is*
* freed up and LOGO will then successfully load/save programs & files.*
****

Apparently, LOGO under TOS 1.4 uses (or at least thinks that it uses) all available memory when it loads. I haven't programmed in years but I would think it would be a simple matter to patch LOGO to correct this. (HINT, HINT to Atari. Or better yet, why not release an updated version of Logo to take advantage of the new machines? :-)

> information?

The best solution is to get TOS 1.4 or later, or a copy of Neodesk, or a copy of DC Format. All three will format IBM-readable disks with no problem.

There are also countless other PD utilities to make pre-1.4 ST disks PC-readable.

Alternatively, just format the disks on the PC.

Question used to be 'what would you do with more than 128K?'

I'm running Neodesk, a 512K Ram disk, Ed_Hak, Neo_Desk CLI, Dr. T's KCS Omega Level II with Tiger, MT32, FB01, and TX81Z patch editors, Song Editor and Copyist loaded. Soon I'll be running XOR with modules for a CZ1 and a Korg 707. Rumor has it (been meaning to look into the doc) that I can run *any* GEM program from in Dr. T's multi-programming environment, so that I can get to Degas and my backgammon program (got to have a little fun sometimes). I'm also planning to retry DCSTUFFER (had a problem with an old version of MACCEL3) so that I can load Breakout (yeah, I know it's silly) and Othello. And maybe I'll even try Cal50 again, though it was doing very strange things last time I tried (but that was also under the old MACCEL3). And I haven't even started working with samples...

Incidentally, I keep the machine booted 24 hours (long load time to get just what I'm using now going, let alone what I'm planning).

So I'm planning to use up my 4 meg in the not so distant future. Jeez, give a user a few meg and they want a gig...

It doesn't work either with TOS 1.2. This would seem to be why Atari removed it from the ST language disk. It is possible to run LOGO.PRG and edit with it, but it falls over itself soon after starting to run a LOGO program. I guess it relies on internal GEM variables in TOS 1.0.

>Are there any patches to make this work ?

I am also interested in finding these.

>
> Questions:
> 1) When will it be relesed ?

On past performance: much later than you want, later than you expect, and a bit later than you'd dared to guess when, taking into account past performance, you were being most pessimistic.

>
> 2) Who will handle distribution (Atari Directly, or through dealers, mail
> order, ...)?

No doubt this will differ from country to country, and Atari UK will try to handle it themselves, then spend a year trying to decide whether to sell it or give it away (based on their treatment of the Epson emulator for the SLM804 and the time it took them to release the presentation graphics program Hyperchart. By the way, Atari UK still sells v1.0 of the Epson emulator, whereas Atari USA gives away v1.31. I know which I use, and I'm sorry I bought the UK product).

> 3) What will it cost, and will it include (as I have heard rumoured) drivers
> for most printers including the HP DeskJet (original version)?

See above. It would, of course, be sensible to include Deskjet drivers, but if space is tight on the disk, then an SMM124 (Atari dot matrix printer, if I've remembered the number correctly) driver might win out.

> 4) Can I get it now by buying Goldeaf's Wordflair II?

I don't know, but I bet a) they'd like to bundle it, and b) the Tramiels won't let them even though the software engineers have had it ready for a while.

> 5) Will this guy ever run out of questions? Why ask why? Why is the sky blue....

On the last question, read 'The Cuckoo's Egg'. Some professor once asked Cliff Stoll the same question in an astronomy exam and had him sweating for hours over the answer.

Wouldn't it be nice if Atari were to prove me wrong on 1-4 above?

I would like to buy a
-Hard disk drive or an
-external DS Floppy disk drive
for the Atari ST.

Any offers, also for other peripherals and software (no games), would be
welcome.

I think the equivalent novice command for extracting full pathnames is

zoo -restore yourzoofile.zoo

By now, of course, you have probably figured out how to use x//...

Question is, what would you do with more than 4 meg on an ST running TOS
(or
MiNT). I've yet to exhaust 4 meg (even with GCC, MGR, and BASH. Emacs
coming
soon... :-)

Aha! Once you start using Emacs you'll know what to do with more than
4M. Besides, it would come in handy for use with Minix.

Can a hard-drive (spec. Megafile 30) be used with a stock 520ST?
Will there be enough memory left to run WordPerfect? Timeworks DTP?

Why are the Megafile 30's being sold off so cheap right now? I know
they're discontinued; but is there anything wrong with them? Are
they upgradeable?

Definitely by all means and most assuredly buy the Magnavox 1CM135
monitor instead of the SC1224. It has 97% as good a picture; but can
also work with IBM clones (CGA), AND has a VCR input jack, so can double
as a TV (thru the vcr); a very very GOOD tv (very high resolution).

It also has the sound running off a separate RCA jack. This can be
routed to the stereo instead of the TV, greatly increasing the ST's
sound quality.

Costs about $300 (your dealer friend may be less) + a custom cable
(cable available from Redmond Cable, Redmond, WA.)
Good luck!

In article <1991Jun04.054518.27602@actrix.gen.nz> Roger.Sheppard@actrix.gen.nz (Roger Sheppard) writes:
>Does any one know if its posible to get Ataries Logo to work with Tos 1.4/1.6
>I do get a out of Memory when I try to load a Logo Program/File,
>Note: The software does load up on a 1040 ST with Tos 1.4.
>Are there any patches to make this work?

I posted this question on GEnie about a year ago when I got TOS 1.4 put in my 1040ST. One of the ST wizards (one of the CodeHeads or one of the Double-Click boys, I don't remember for sure) came up with the answer:

****
* Trick LOGO by loading a RAM disk first (such as SI_RAM which is an *
* accessory), then load LOGO, then remove the RAM disk. The memory is*
* freed up and LOGO will then successfully load/save programs & files.*
****

Apparently, LOGO under TOS 1.4 uses (or at least thinks that it uses) all available memory when it loads. I haven't programmed in years but I would think it would be a simple matter to patch LOGO to correct this. (HINT, HINT to Atari. Or better yet, why not release an updated version of Logo to take advantage of the new machines? :-)

Well:
It is finished... . Reprinted below is the opening letter from my catalogue. So as not to rankle anyone, the actual catalogue will not be posted here, at least not by me. I hope that this letter is acceptable. I don't see any reason for it not being so. I apologize to anyone who gets upset though. I post it here, as I have not yet finished compiling my mailing list yet. I have all your names, but I need to get them into a format with which I can do a group mailing, so I do not have to send each one out by hand. ASAP, though. If anyone else wants on, send me e-mail, and I will sort you out from the flood and put you one the list. Man, this is getting time consuming for a hobby! :(
Anyway, so here it is:
O.K.:
Hi out there. I just finished the damn news brief, and unlike my original intent, it did turn out to be a catalogue. I am not one to call a spade anything other than what it is, so, this is the Damn Catalogue. Why that title. It took me hours (days) of boring tedious work, strained my eyes, and almost drove me nuts. I compared prices with the ratail, and with "real" mail order houses, to try to get you folks the best deals I could muster. I spent eons staring at increadibly small type, went through vials of eye drops, and I learned some things. #1. ComputAbility has really good prices. #2. Damn, the mail order folks have low margins! Sometimes I was not able to go lower, othertimes, I even have to pay more than them! I do think that in general you will find that this is a good service for you, with the lowest prices you can get. Why else would I do it? Well, here are the specifics. Everyone seems to want me to start this as a real business, do it full time or something, hire staff, etc. There have been lots of calls for accepting credit cards, shipping overseas, doing periferal stuff, like music equipment, and other big time requests. Remember the spirit of this, though! I am a socialist! :) I have no intention of going into the retail business, as I find it immensly boring. This is not my job, but a favour. I saw how dealers were dropping like flies, how there were no more big glossy magazines in which the mailorder houses could advertise, and generally a complete inability for many of you to get Atari stuff, and I saw a chance to help out, with some connections I had made back when I WAS concidering being an Atari dealer. But this is just a hobby. I can not make the promises of the big folks, I can not provide as timely of a response. But I WILL TRY to do my BEST. So... I am looking into the possibility of accepting credit cards, but at the moment, it will have to be money order, cash or personal check (I am not responsible if you send cash of course :( ). I will see about overseas shipping, but I will have to talk to my bank about how it would be arranged, all that stuff about checks drawn on US funds and such, but I

think I can work it out by the end of next week, if I get the time. Now, shipping will cost $3.00 for most software orders, regardless of quantity. So if you buy 15 things, it's still $3.00. I would prefer it if you did buy in groups, as the prices of many things, especially of the games are such that I may take a loss on many single purchases with small orders. I can do this sometimes, if there are a lot of multiple orders. This is because I have to order a minimum amount not to be charged an additional fee. So, if one person orders a lot, or several folks order less, I'll be O.K.. Here's keeping my fingers crossed. On hardware, it will depend on the weight, as I refuse to do some sorta percentage thing, and make money on the shipping too. The only one who will make out from the shipping is UPS, or Fed Ex (yes, I will next day air, for a bit more!). What is this handling charge BS anyway? Shouldn't that be included in your prices? Why profit twice, except to make your prices seem lower? This has always irked me. Anyway, I'll have to see about overseas shipping rates. If there is something that you want that is not here, I can probably get it. This is by no means a comprehensive list (what, you think I'm nuts?) and so just e-mail me if you want something else. My real time number is (412) 422-3983 if you need to have it. What you want me to get an 800 number too. Man you DO think I'm crazy! (But it would be sorta cool to have my own 800 number though. Hmmm... .) O.K., lastly, I have not gotten the new edition of my pricelist, never mind typos, so some of these prices could be wrong. I doubt anything will go up. If anything, they will go down. I think just about all of it is right, though. But if something seems just too crazy, like DEGAS Elite for 15,000.00, then drop me a line, and I'll fix it, and give you the real price. And if someone is selling it for less, tell me, and I'll look into it. So, with no further ado, here it is:

love ya all

Christoph Strunk's port of gcc 1.39, g++ 1.39.0 and libg++ 1.39.0 is on

ftp.thp.Uni-Koeln.DE [134.95.64.1]

~ftp/pub/atari/gnu/g++/cs

(If this doesn't work you can try ftp.Uni-Koeln.DE [134.95.80.1]:/thp/atari.)

Hope this helps.

Rainer

SLM804, the laser printer, barely runs on a MEGA2. 4 mb is simply not enough
if you have other program in memory.
Tsuji

P.S.
I think adding a fast disk (say 900 Kilo bytes/sec) is cost effective than
adding two or four megabytes of memory above 4 mb on my old Mega4.

I heard this works on TOS 1.6 if you put the 256k SIMMs as the first bank
and the 1M SIMMs as the second bank. But I could be wrong. If you're
having trouble, though, it's trivial to try it the other way.

JL>running. i know that 'cause i was it who told him the `trick'... :-)

I'm rather sure; I tested several cases which were compiled into
16-Bit-Code by the 1.x compiler: the 2.0 compiler generated the correct
code for 32 bit indexing.
But of course there could still be some bug lurking...

JL>> It wasn't really a bug but a "design restriction" - it made programs both
JL>> smaller and faster (it's even mentioned somewhere in the manual!).
JL>
JL> not in my manual (TC 1.1 that is). and besides, what does ANSI
JL>say about this?

I got it mixed up - it's not in the 1.0/1.1 manual but in the accompanying
README file!

And since it is documented, it can't be a bug - it must be a feature! ;-))
(But of course you're right: from an ANSI point of view the compiler is
"broken" since it violates the "model" of the C language.)

The funny thing is: in version 2.0, they moved this info from the README
file into the printed manual; at the same time, they fixed the problem!

JL>> The new compiler uses only 16 bits for array addressing if and only if it
JL>is
JL>> sure that the array addressed is smaller than 32 KBytes.
JL>
JL> ummm... how can it be sure when i, for example calloc()ed the thing?

It's simple: it can't be sure - and so of course it will not use 16 bit
("short") addressing! :-)
As far as I know, the compiler uses "short" addressing only on arrays<=32KB
if they are declared in the same module, and _never_ on poiners...

Thanks to everyone who replied to my previous posting. So far I had been formatting on the PC but it was getting tiresome when I had to keep running out to the campus just to format another dozen or so disks. The information is very useful.

Steve, thanks for the information on the bytes to be changed. I'll try it as soon as possible.

I have just seen an ad in a catalog from E. Arthur Brown for
MultiGEM, which is said to be a multitasking system for the ST.
Does anybody know anything about it? In particular:

1. How good is it? Will it run, for example, dvist and unix
windows? Will it permit a background kermit transfer via unix
windows or uniterm?

2. How does it compare to MiNT?

3. Does it run on a TT? If not, is there a version for the TT?

Please send me e-mail, and I will summarize to the net. Thank you.

Try Best Electronics in San Jose, CA. They specialize in such kinds of accessories for Atari 8-bit and ST computers. I don't have their address or phone handy, but the appropriate information operator would have it. Try 408/555-1212 or 415/555-1212.

| Could someone please extract the following files from texdr179.zlh at
| terminator.cc.umich.edu and send them to me in arc format, not lzh.
| My unix machine doesn't like the leading slashes in the lzh archive.

Concerning this request, I just uploaded to atari.archive a version of
texdr179.lzh repacked without the leading "/" since I am sure that
others might have the same problem. I also had very much difficulty
in extracting from the original file. Arrgh!! ;-{

| Many thanks.
|
| P.S. A plea to quit using these brain-damaged lzh/laharc programs!
| Use arc602.

This part I do not understand: the request for arc602. I believe that
it still does not run on Unix machines. Correct me if I'm wrong.

Cheers,

I think GNU SmallTalk is similar. It does seem strange that Atari limited the machine like this. Surely it wouldn't have been much more work to allow the MMU to address the full 16 meg that the 68k can? At least it's better than the Amiga A500 (1 meg max!).

From: dpg@cs.nott.ac.uk
Message-ID: <1991Jun6.110356.24886@cs.nott.ac.uk>
Source record: 231499

I've just finished a new version of MiNT-BASH 1.05. Question is, do people want me to post the binary to atari.archive or will the diffs (from the original (but patched) distribution) suffice?

The new version has the follow advantages over Eric Smith's original port:

o It's about 30k smaller (not much :-( )
o It doesn't die if given a 14 char filename (Minix partition)
o You can now put a hostname in PS1/PS2 prompts (I call my machine tiny68)
o It doesn't appear to suffer from the bug afflicting both BASH and ksh which causes them to send themselves SIGSTOP at a random point in time. (I haven't found the bug, though.)

If anyone wants any other particular features, nows the time to say so. :-)

Are there possibilities to change parts of the AES (for
example to change the window manager- make windows faster,
give them a nicer (X-like) look..)? How (uniformly) is AES
programmed on STs/TTs? Are there (of course, undocumented)'
fixed functions for the internal line F calls, and are they
still used in the TT/ 68030-68882 ?
(I guess this is all a large dream, for I've never seen
any programs do this without replacing the ENTIRE AES, but
if someone has any hints, I'd be most grateful to hear them.)

Well you could try the firm that makes it, Trio Engineering,,
But I think that Spectrum was replaced with Unispec, now Unispec II,
if I remember,
It has the option to copy other sceens to Unispec (Sectrum), can run as
a ACC.
I would like to find out my self if they are still supporting the
Atari computers, ?.

>I've got a Mega 4 running U.S. TOS 1.4. Any suggestions?

You need to adjust your color monitor. I had to when I first bought my machine, and have not had to since (so you should not have to do it every time you switch Hz). However, others have stated that they did not have as much success. It does not hurt to try though. There are a couple of marked plastic pot screws embeded in the back of the monitor. Find the v-hold one and turn (ONLY use a plastic TV screwdriver, and be careful).

A much easier way is to use a formatter that does it for you. Most programs
that offer formatting do (including the hardcoded one in TOS 1.4). For a
quick solution, ps2form.tos from atari.archive.umich.edu works for me. It
will format disks so they can be read by any IBM compat (including the ps/2,
which for some reason has more trouble that others). I have been using it
for about 3 years with no problems. Also, Neodesk 3.0 formats to IBM specs,
as does (I think) Universal Item Selector III.

There was some thing posted here , was it last year from a German
chap, that could bank switch the rams to give , was it 6-8 megs, but I
could be wrong, I could still have the Posing stuck on a follopy some where,
if I remember gave details on how to do it.
but a still can't see how you can refresh the rams.

>they're discontinued; but is there anything wrong with them? Are
>they upgradeable?
>
I can't answer most of the questions, but having been in the market for
a hard drive recently, I can tell you that every dealer I've talked to
about the Megafile 30 has had the same response: "They're really slow.
Most of my customers can't deal with anything this slow."

Mind that they're dealers with non-Atari drives to sell, but it became
the expected response whenever I talked to one of them. I found a
49M 28ns drive from Carter Graphics for $414 that I'm waiting for now.
Atari's Megafile was $365 at most places that would touch them. Seemed
like a simple choice to me.

When I bought my ST (in '87), I was disappointed by the quality of the color
monitor I received (I'd seen a friend's ST & color monitor -- one of the
original ones that was nice and crisp). Soon thereafter, I took the back off
of the monitor & proceeded to adjust every pot in sight, hoping that I could
get it to look like my friend's. Needless to say, I got everything all out of
whack... I managed to get it looking decent again, but have always wondered
if it's adjusted the way it should be. Can anyone offer suggestions on how
to check my adjustments -- rules of thumb, and the like? Perhaps a color bar
program... That sort of thing...

Thanks in advance...

Bob is indeed a special person, being the revered icon of the Church of the
Sub-Genius.

Speaking of cutting some slack, I flipped through the cable television
channels the other night and caught the last minute or two of a half-hour
Bob special. I don't know what channel it was; we have too many to keep
track of.

201. Re: LOGO

Newsgroup: comp.sys.atari.st
Date: 1991-06-06 17:54:02 UTC
From: jan@janhh.hanse.de
Message-ID: <1558.06.91@janhh.hanse.de>
Source record: 231492

Roger Sheppard asked:
>Does any one know if its posible to get Ataries Logo to work with Tos 1.4/1.6
>I do get a out of Memory when I try to load a Logo Program/File,
>Note: The software does load up on a 1040 ST with Tos 1.4.
>Are there any patches to make this work?

I just took a look at it and I guess I found the problem:

For some stupid reason LOGO tries repeatedly to allocate all
available memory until malloc(-1) returns zero. After that it
does it's Mfree().

To solve the problem you have to apply the following patch using
some kind of a disk utility.

The patch starts at offset $5C (relative to he beginning of the file).

original: $4eb9, $0001, $2fec, $4a40, $670c, $2f00, $4eb9, $0001, $2fba,
$588f, $60ea

patched : $4a79, $0001, $2fec, $4e71, $4e71, $4e71, $4a79, $0001, $2fba,
$4e71, $4e71

Maybe this is the rebirth of ST-LOGO... :-)

Happy hacking,
Jan

Source record: 231493

Hi Lauren,
Yes, a hard drive such as the Megafile 30 can be used with a "stock" 520ST, although I doubt there would be enough memory left to run either WordPerfect or Publisher ST. You could however run the likes of WordWriter and Publishing Partner. Having a hard drive connected to a 512k ST really restricts which programs you can use; this would be an excellent time to upgrade your computer.
Megafiles are so cheap now, because hard drive prices are at an all-time low; and this is industry wide (not just Atari). There is nothing wrong with the Megafile 30's; low OEM prices of the mechanism and market competition allow the price to be low. Yes, the Megafile 30's are upgradeable; one of the most popular replacement mechanisms for the Megafile 30 is the Mitsubishi MR535. The MR535 (when connected to a RLL controller, like the Megafile 30 has) is a 65m, 25ms hard drive; it simply plugs and mounts in the same place as the Megafile 30's Seagate ST238R mechanism, although you will need different software to format and partition the drive with (such as Supra's Hard Drive Utilities, Diamond Cache would be nice too). I hope this helps, take care. Bye.....

Luis

There are plenty of third-party expansion devices to take the A500
to as much as 9 megs; you just can't get such devices from Commodore.

204. Using BART for large files

Newsgroup: comp.sys.atari.st
Date: 1991-06-06 18:17:51 UTC
From: cscullio@ncratl.AtlantaGA.NCR.COM
Message-ID: <19141@ncratl.AtlantaGA.NCR.COM>
Source record: 231494

I've been trying to retrieve the file 'printing/gsbin.zoo' with BART, but I never get a response. I've gotten plenty of other files with BART, so I believe I'm using it correctly and I've checked the spelling many times. I think that the fact that this is a large file (605K, according to the Index) may be the problem. Assuming that this file's size is greater than the daily retrieval limit with BART, and that I don't have ftp capability, does anyone have suggestions on how I can get this file?

Thanks.

Were you trying to run zoo from the desktop and do you have TOS 1.0?
The TOS 1.0 desktop converts all TTP parameters to uppercase. So,
instead of zoo seeing a -x option, it sees -X which it doesn't
understand. Try using a CLI (one that doesn't convert parameters to

Or maybe you could try:
zoo x// d:\term\download\sozobon1.zoo

(i.e., without the {}[]).
if you are using some comand shell, and not the desktop, maybe you
should use / instead of \ in the pathname...
-jp

>If you send me a disk and the stamps you'll receive the LZH 1.13.21 or
>a newer version. The bugs you described are fixed at 1.13.20.

months ago i started a debate on the (current) weakness of lharc. since
then, it seems nothing has changed: MANY people still have compatibility
problems (at least 10 articles complaining in the last month). and still
we bicker over pennies (i can get bulk DSDD disks for $0.39US each).

and now we have yet another potentially incompatible version, with a
new version numbering scheme. why can't you guys who write these
versions get together and decide on a standard already? i say "potentially"
incompatible because i have not used it nor read its docs. but where
lharc is concerned, it is safe to expect the worst :-(. and the terminator
guys and steve grimm should be on that "committee", too, so we at least
try for compatibility (already). sheesh...

oh well...

-bill
rosenkra@convex.com
(i NEVER use lharc :-)

BTW: i am pleased to see compressed tar files appearing :-). hint, hint...
the .taz file is the wave of the future! now if only GEMDOS could support
file.tar.Z naming...

209. XOR (Was RE: More than 4 Meg?)

Newsgroup: comp.sys.atari.st
Date: 1991-06-06 18:56:50 UTC
From: SYSPMZT@gecrdvm1.crd.ge.com
Message-ID: <91157.145650SYSPMZT@GECRDVM1.BITNET>
Source record: 231417

I can't reply to Ralph Berg, who asked about programming for the Cazio CZ1 with XOR:

XOR is a generic patch editor that runs in Dr. T's KCS Multi-Programming Environment (MPE). It can also be run as a standalone program. As I understand it, XOR uses modules that describes the programming requirements for a given synth, and then uses a generalized interface to allow that programming. Feedback from the synth category was very favorable to XOR over other available packages. I like the idea of going to XOR since it s supports a lot of synths, some of which are not exactly popular models. .

If you're not familiar with Dr. T's, they write a lot of midi software that may not always have the greatest flexibility right off the bat, but are well supported in upgrades, and are reasonably priced. I've stayed with the KCS through 4 upgrades now, and with Tiger and Level II, have an extremely powerful sequencer environment that supports the functioning of many external programs; last night I figured how to initiate other GEM programs from within the KCS so that I don't have to reload my sequencer configuration just to get to my all-important Daleks game...

>Questions:
>1) When will it be relesed ?

According to a letter from Goldleaf, there is less than two weeks before it is released. Seems that Goldlead is just itching to send it out ASAP (after all, they have possibly the only FSM-ready program on the market, thus the new GDOS is a selling point.)

>2) Who will handle distribution (Atari Directly, or through dealers, mail
> order, ...)?

Probably all channels. I would hope that they distribute it in addition to the old GDOS (in software packages.)

>3) What will it cost, and will it include (as I have heard rumoured) drivers
> for most printers including the HP DeskJet (original version)?

Cost? Beats me. It's supposed to include a DJ driver, as well as an HP Laserjet driver and Epson drivers. They'd be stupid to drop any drivers in the package.

>4) Can I get it now by buying Goldeaf's Wordflair II?

No. They are going to charge cost plus shipping and handling when they sell FSM.

Well, now I know why Bob is seen on the dialog box of the ram disk I use.
I'd thought that the programmer was really cool to spend the time drawing
Bob. Now I know that the real cool person is or was hidden inside Atari
while they were developing the machine.

For all the deficiencies of the operating system, at least it offers
slack to all who seek.

If you can select the "Blitter" option, do so. It is a special graphic chip inside the machine that allows it to do Hardware Scrolling. It makes for faster, smoother scrolling. I'm not sure about the other capabilities. It is better than the standard, though, so use it if you can.

214. GIF decompressor in GFA Basic 3.0 (not a viewer)

Newsgroup: comp.sys.atari.st
Date: 1991-06-06 23:31:06 UTC
From: logajan@ns.network.com
Message-ID: <1991Jun6.233106.1575@ns.network.com>
Source record: 231437

```
REM This GFA Basic 3.0 program unpacks the images in GIF files, creating RGB
REM color tables, and an uncompressed image array. Each byte in the image
REM array points into the intensity values in the RGB color tables. This means
REM the image can contain only 256 different colors, but those colors can be
REM selected from a palette of 16.7 million.
REM
REM *THIS IS NOT A COMPLETE PROGRAM* It does not display the GIF images.
REM I leave that up to you to figure out how to do. Good luck. By the way,
REM this is pretty slow. It does run much faster if compiled.
REM
REM Totally original code by John Logajan, June 6, 1991. I don't know what
REM legal status it has, as CompuServe owns GIF, and I've heard rumors that
REM the owners of the LZW compression routines aren't happy with CompuServe.
REM If it was up to me, this code would be released into the public domain.
REM

215. Reading 8-bit disks with an ST

Newsgroup: comp.sys.atari.st
Date: 1991-06-07 00:33:16 UTC
From: revpk@cellar.UUCP
Message-ID: <6DB632w164w@cellar.UUCP>
Source record: 231444

I've got several megs' worth of old and very important text files on floppy disks, leftovers from when I used an 8-bit Atari. Now that I have an ST, I'd really like to be able to bring the text into my new machine and transfer it to 720K floppies.

Can anyone either outline or recommend a way for me to work up a quick transfer system? Is it possible to hitch an old 810 disk drive to an ST, and read ASCII files from it>

Advice-- and especially a solution-- would be greatly appreciated.

>> 2Mb = 2 x 1Mb SIMMs
>> 2.5Mb = 2 x 1Mb SIMMs + 2 x 256K SIMMs (Not with TOS 1.6)
> ^^
>I heard this works on TOS 1.6 if you put the 256k SIMMs as the first bank
>and the 1M SIMMs as the second bank. But I could be wrong. If you're
>having trouble, though, it's trivial to try it the other way.
>> 4Mb = 4 x 1Mb SIMMs

There's a file at atari.archive that fixes the 2.5 meg problem... It's called
SIMMFIX.

You put it in your auto folder. It reprograms the MMU, then does a warmstart.

I get 2 bombs on the first boot attempt, but when the machine resets, it does
just fine. Any subsequent warmstarts just boot right up.

Be sure to read the instructions....

Hope this helps,
Tony

217. FIX24.PRG + ADDMEM.PRG (need info)

Newsgroup: comp.sys.atari.st
Date: 1991-06-07 02:26:30 UTC
From: adamd@rhi.hi.is
Message-ID: <3230@krafla.rhi.hi.is>
Source record: 231425

I had the honour of seeing the first TT to arrive in Iceland. It has version TOS 3.01 (UK) in it. Fix24 works fine straight up out of ST Computer magazine from Germany, but we cannot get addmem to work because it uses an undocumented memory location in TOS 3.01 (DE) to fiddle with the MPB. The address in the german version is $71E2 but the english version has nothing significant at that address. It is not likely to be a misprint because it is repeated more than once. Can anyone help us with a solution?

For those who don't know what these programs do:
Fix24 installs TT ram immediately above the ST ram.
Addmem lets TOS use the relocated TT ram as fast ST ram.

What are people using for this purpose, and where is it hidden?

218. Autobooting Drive C

Newsgroup: comp.sys.atari.st
Date: 1991-06-07 03:01:21 UTC
From: rome@ucscb.ucsc.edu
Message-ID: <16765@darkstar.ucsc.edu>
Source record: 231440

I am borrowing my friend's Mega 2 for the summer and he has an SHS205 hard drive attatched. When I got it, it would boot all of the stuff in the AUTO folder on the C partition (actually, that was the only thing that it would boot, it would not read a floppy at bootup!) I seemed to have messed something up and now it will not boot off the hard drive, I have to boot off a floppy and with all of the utilities, it takes forever. Does anyone know how I can fix the C partition to autoboot again???????

Thanks,
Roman Baker

220. How to buy SIMMs for the ST

Newsgroup: comp.sys.atari.st
Date: 1991-06-07 05:44:22 UTC
From: kurrer@stockholm
Message-ID: <1991Jun7.054422.261@ux1.cso.uiuc.edu>
Source record: 231448

I plan to buy 4MB of SIMM to boost up an 1986 Atari 1040 ST with 1MB and TOS on ROM. (My Atari is back in Europe and I haven't touched it for a long time.) It would be great if someone could answer some of my questions:

Will any SIMM's do, or are there any size restrictions?

Will any version of the ROM system allow this upgrade? I fear that I have a pretty old version like 1.2 or the like. If I need a newer version of the ROM, where can I get it?

Answers by email or posting welcome.

Christian Kurrer

221. ST/TT: two scsi bus masters

Newsgroup: comp.sys.atari.st
Date: 1991-06-07 06:22:51 UTC
From: meulenbr@cst.prl.philips.nl
Message-ID: <meulenbr.676275771@cstw163>
Source record: 231324

Hi,

I was wondering whether is would be possible to share a hard disk
between two computers.
The disk in question is a disk with a separate host adaptor and an
Adaptec 4000 scsi<->st506 board.
I was wondering if it is possible to share this disk between two
computers. Could this sharing be done on the acsi level, or only
at the scsi level.
If this is hardware-wise possible, could then both computers use
the same disk at the same time, or would that require software
or hardware support which is not present.
If the adaptec has two disks connected, would it then be possible
for each of the computers to use one of the disks.

I know, I can plug the disk to the other system, but I foresee
that I'll have to use both systems for a while, while moving from
the one to the other. Both systems need the same data, so the only
other solution seems to be to do cable juggling each time a
transition between systems is made. I'd rather not do so.

Anyone any experience/knowledge/information??

Thanks,
--

222. TT ram revisited

Newsgroup: comp.sys.atari.st
Date: 1991-06-07 06:31:07 UTC
From: meulenbr@cst.prl.philips.nl
Message-ID: <meulenbr.676276267@cstw163>
Source record: 231323

Hi,

Thanks to all who responded on my TT ram question.
I won't summarize here. Allen Pratt dealt with the question in great
detail. I don't think I should just duplicate that.

I'm left with a few small questions.

Allen says that in the future you can buy 16 MB of TT RAM
from atari. Could I do such an upgrade by myself by just
replacing the 1 MB simms by 4 MB ones, or are there other caveats?

Also I found out that the TT ram is 100ns ram. I do not have any 68030
doc handy, but with a 32 Mhz clock, I think at least one (and very maybe 2)
wait states will be required to access this memory.
Would it be technically feasible to replace this memory with faster
memory, and get rid of this wait state? Will 80 ns be enough to get rid
of the wait state, or should 60 ns be used??

Since, if I'm not mistaken, the 68030 requires at least 3 clock cycles to
do a memory access. So removing a wait cycle would speed up the memory
access from 4 to 3 cycles. which would (in theory) lead to a speed
gain of something like 25 %. Now of course not all cpu activity is
memory access, so perhaps this figure is on the high side, but it seems
to me that a substantial gain could be obtained here.

223. TT HD floppy

Newsgroup: comp.sys.atari.st
Date: 1991-06-07 06:45:55 UTC
From: meulenbr@cst.prl.philips.nl
Message-ID: <meulenbr.676277155@cstw163>
Source record: 231322

I've heard rumours in the past that future TT versions will be equipped
with a HD floppy drive. This leads to the following questions:
- Is this rumour true?

and if so:
- Has there been mentioned anything about the time frame in which this
should occur?
- will it be possible to upgrade current TT's?

Thanks for the info!

224. Re: Requirements for g++

Newsgroup: comp.sys.atari.st
Date: 1991-06-07 08:14:00 UTC
From: gjh@hplb.hpl.hp.com
Message-ID: <GJH.91Jun7091400@ghiggins.hpl.hp.com>
Source record: 231418

```
++ Simple question time: do I need gcc if I want to use g++? Having forked out
++ the dosh on Lattice C v5 (pretty goo, BTW) I'd rather not have to get
++ another C compiler :-)

Doesn't' look like it, but that's just a guess, this is part of the readme from
the koeln.de version of G++

++ Here is a version of G++ 1.39.0 for the Atari ST based on GCC 1.39.
++ You should know a few things about it:
++
++ 1. G++.TTP is the C++ main driver. The *only* difference between GCC.TTP
++ and G++.TTP is that G++ assumes `.c' files to be C++ code while GCC
++ assumes `.c' files to be C code. You will normally use the extension
++ `.cc' for C++ code. In this case there is no need to use G++.TTP;
++ just use the equivalent GCC.TTP.
++
++ 2. When compiling C++ code you should `setenv UNIXMODE=._/LAH' because
++ the GNU C++ lib header files have case-sensitive names, i.e. `String.h'
++ is different from `string.h' !!!
++
++ 3. When linking C++ code (with GCC.TTP or the equivalent G++.TTP) you *must*
++ explicitly specify the `-lg++' linker option.
++
++ 4. A few bugs fixes and extensions were made to the standard GNU C headers,
++ libs, and utilities (like `gcc-ld.ttp'). Do not use other versions
++ of GNU C headers, libs, and utilities.

225. uploaded xcontrol.lzh to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1991-06-07 09:18:31 UTC
From: ralph@laas.fr
Message-ID: <RALPH.91Jun7111831@orion.laas.fr>
Source record: 231052

I have just uploaded xcontrol.lzh, the new Atari replacement
for control.acc. I belive that it replaces chmelion.acc completely.

I have recovered it from the public "Atari Magazine" BBS (run
by Atari France). It was a self-extracting version. Atari Magazine
claimed that it would work on plain STs and STes. I am here to state
that it does work on both. I have also included maccel3.prg and a few
MegaSTe *.cpx files since they also work on STs and STes (depending
upon the capacity of the machine).

In the case that Atari does not want their release, they are
all dated "Dec 12 1990" so that atari.archive can delete them.

Cheers,

Source record: 231423

6600hien@ucsbuxa.ucsb.edu (Hien Le) writes:
>Hello everyone! I've never used a modem before.

Hello Hien,

Any modem will do, try to get one with at least 2400 baud. More will be expensive, less is too slow, but 2400 is just correct.

Communication software is a very simple thing, just reading from RS232 and displaying on screen and reading from keyboard and sending to RS232. So, terminal programs use to give a lot of other features, like RS232 configuration, automatic dialing (most modems can do this so the software simply has to send a string to the modem to dial a number), capturing (writing everyting that was sent and received into a file) and many, many more. My favourite terminal prg is Rufus, a German produkt with a nice user interface and many features. Another one is Uniterm which also gives a lot of features.

Try to get one of these, connect your modem and off you go. It's really easy, all you need is the phone number of a nearby mailbox (BBS). Be sure to set the communication parameters to 8 bits, no parity, 1 stop bit (usually written 8N1), this will do for almost all BBSs. Most BBSs support 2400 baud and are able to determine what speed you are using so there is no need to care about this, even if the BBS supports 9600 baud or something like this.

Have fun!

228. Review of LHARC Test Archive Function

Newsgroup: comp.sys.atari.st
Date: 1991-06-07 10:03:59 UTC
From: ralph@laas.fr
Message-ID: <RALPH.91Jun7120359@orion.laas.fr>
Source record: 231146
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Disclaimer: Errors may have been made in the following discussion. Please excuse me for such. The following says absolutely *nothing* about the capacity of the programs to extract or create LHARC archive files.

I collected as many versions of lharc as I could find on the net. I tested them on orbit.lzh (at atari.archive) as well as a lharcsrc.lzh that Bammi had passed to me. Orbit.lzh starts with an uncompressed member file hiscore.orb, which seems to be troublesome. I would very much appreciate to hear if others have succeeded testing these files where I have failed!

The testing was conducted on a Mega 4 ST under TOS 1.2 with a 1 Mb RAM disk. The *.lzh files were on the RAM disk and the test was performed under Gulam with the archive programs under test on drive A:\

Name & Version	Author	Result	Comments
Lharc 0.40 beta	Jon Webb	21 CRC Errors(1)	Needs *.* file spec.
Lharc (Unix)1.02	B. Shroka	2 Bombs(2)/OK	
Lharc 1.13b	Thomas Questar	No File Found	
Lharc 1.1308	"	"	"
Lharc 1.1309	"	"	"
Lharc 1.1318	"	22 CRC not supp.	Needs -u option(3)
Lzh11319.ttp	"	22 CRC not supp.	Needs -u option(3)
Lhxarc 1.01	Jon Soerensen	22 CRC Errors	
Lha.ttp 1.21	Roger Burrows	OK	
Fastlzh.ttp 2.8	Gary Burke	OK	
unlzh.prg 1.1	John Harris	Fails Uncompressed/OK(4)	
unlzh.prg 1.4	"	Bad CRC Uncomp./OK(4)	
unlzh.prp 1.72	"	OK	

(1) When only 1 result is given it applies to both orbit.lzh and lharcsrc.lzh.
(2) This version does not appreciate uncompressed members in an archive. It is the only one based on PC version 1.13c!
(3) Otherwise, "No File Found."
(4) Test listing truncates long file names. Both these versions used to abort for me when I had TOS 1.0 on a 1040 ST!

I hope that these results might be of use to all.

I cannot give you a solution, but I can tell you where one is. You need
to get STXformer (the 8-bit emulator), and make a cable. At that point,
you can hook an 810 to your ST and read disks. I don't know the details.

Of course, if you have an 850 you could always direct-connect the two
together and modem them over . . . .

Before you rave/rant about some one elses product, you could have at
least tried or tested it out, at least this chap is trying to make
a better LZH, and fixes those compatiblity problems that you are on about,
and did you know that its the fastes LZH to date.

Also note, Arcshell C.F.Johnson (Little Green Footballs) now has
support for it, he has not so far supported the other lzh programs
that you are on about..

So why not give it a try, and then eat your words..

Well from what we have seen here in New Zealand that the New Atari monitor is very pore, it has a dot pitch of 0.42 mm, and with a grey screen.

This is now what your are getting from some of the better TV's..

The First Atari monitor had a 0.38 mm dot pitch with a black screen, the GoldStar has a 0.39 mm dot pitch, but not much of a black sceen.

There was anothere monitor that I have seen in USA Mags but not here, this had a slanted on/off switch

I don't rate the new monitor at all, its a funny thing that the Amiga monitor has had similar changes, its now a 0.42 mm dot pitch with a grey screen.

Get Version 2 of simm fix, it states that the problem is with the OS
and not the MMU, I have played with a STE with 2.5 megs and found no
problems ?? and the MMU had the correct bits set in it..

236. arc602.ttp or unarc.ttp question

Newsgroup: comp.sys.atari.st
Date: 1991-06-07 13:12:53 UTC
From: ralph@prosun.first.gmd.de
Message-ID: <727@bigfoot.first.gmd.de>
Source record: 231432

Hi,

How can I tell arc602.ttp or unarc.ttp to store on
extraction the files into another directory as where
the archiver programms resides???

When I use unarc.ttp with "x c:\tmp\any.arc" the
extracted files will be stored where the unarc program
is called ??

Who has any idea ???

Thanks.

Ralph Berg, Reichenbergerstr.89,
D-1000 Berlin 36, West Germany during day 030/25499151

>XOR is a generic patch editor that runs in Dr. T's KCS Multi-Programming
>Environment (MPE). It can also be run as a standalone program. As I
>understand it, XOR uses modules that describes the programming requirements
>for a given synth, and then uses a generalized interface to allow that
>programming.

I wouldn't call X-or a "generic" patch editor, because that would
imply that it works for all instruments the same way. Rather, it
is a universal patch editor/librarian which can be used on any MIDI
instrument that has an X-or "profile" written for it. The profile
translates system exclusive messages into parameters that the user
may manipulate directly with sliders, text boxes and envelope windows
on X-or's screen. A program called E-or is included with X-or to
allow you to write your own profiles or customize existing ones to
your needs. If you've ever tried working with a patch editor and
wished you could change the screen layout so that all of your most
often used controllers were in the same area on the screen, this is
for you.

Moreover, X-or lets you connect all of your synthesizers together and
manage them as if they were a single instrument.

The best way to describe X-or is as a total system used to control
and manage MIDI system exclusive data, whether your MIDI machine
is a synth, sampler, effects device, switcher, mixer, preamp or
tape recorder. Any parameter that may be accessed by MIDI can be
controlled by X-or, even if that parameter is unique to your machine.

>Feedback from the synth category was very favorable to XOR
>over other available packages. I like the idea of going to XOR since it
>supports a lot of synths, some of which are not exactly popular models.

Yah, is good. I especially like the fact that I can hack out new
profiles myself, instead of waiting for someone else to do it.

E-mail me if you'd like a copy of the X-or review I posted here a few
months back.

Oh, and Dr.T's on-line support has moved to GEnie. It gives you
access to the wizards, as well as the latest profiles written by
Dr.T's and users.

You can use Derek Mihocka's (sp?) X-Former software. It requires
a special cable to go between the ST's printer port and the 8-bit drive, but
you can then read the 8-bit files into your ST.
```

240. BART Help File

Newsgroup: comp.sys.atari.st
Date: 1991-06-07 15:43:31 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Jun7.154331.7890@terminator.cc.umich.edu>
Source record: 231446

{There's been a literal ton of mail this week on how to use bart. I hope this will clear up a few questions. Please read it very carefully, and then ask questions. People who don't read it and ask first will be shot. People attempting to subvert the quota system will also be shot. People who watch Viva Las Vegas on the Disneyt Channel this evening will also be shot. But, I digress.... -weiner}

The Terminator Atari Archive Help File

Welcome to BART, Brode's Archive Retrieval Thang, Terminator's Atari mail server. To use the server, send a message to atari@atari.archive.umich.edu. The subject line is ignored. The body of the message should contain, one per line, any of the following commands. Each of the commands sends its output back to you via mail.

"help"
This command tells BART to send you this file.

"index"
This command tells BART to send you the Index. Currently, the index is a listing of all the files int the Atari area. Descriptions of various files can sometimes be found in the Index file of each directory. These must be requested individually with the send command. They are currently incomplete, but it's all we have for now.

"path mail-address"
This command tells BART where to send the requested files. This is useful for specifying a mail path.

"send directory/filename"
This is the command that sends out files from the archive. The server only lets you get files from the ~atari hierarchy so you only have to specify the subdirectories in the atari tree. You can determine the path and filename from the Index file. For example, if you wanted to get arc, you'd send a message with a line in the body that looked like
send archivers/arc.ttp
to get the index file, use
send Index
Binary programs are uuencoded before they are sent out. If you miss parts of a file, rather than re-request the whole thing, you can give BART a comma separated list of the parts you are missing and it will send you

those parts. For example...
send languages/gcc.arc aa,ac,af
This is the only way to get files larger than 400K.
You must request the file by parts until you have the
whole thing. A full part is approximately 30k of data.
Note: BART does not accept wildcards such as ? or *.

"sendb directory/filename"
This is similar to the send command except that it
always uuencodes the files that it sends out. Send
tries to determine whether it is sending a binary
or ascii file and only sends uuencoded messages when
necessary.

While the commands are not case sensitive, the filenames are, so be
careful you are using the correct case before complaining that the server
is broken.

You are limited to 400k and/or 5 files per day. It takes 24 hours from
the time that bart received your last message to clear your quota
records. BART does not queue requests that went over quota and send them
out later. You have to re-request them 24 hours later.

BART tends to ignore your mistakes. You will not receive a message back
if you gave an illegimate command or specified a bad file name. This was
a deliberate design decision. It may not be user friendly, but it keeps
the mail queues short and prevents a couple other nasty things.

Submissions are always welcome. Please mail them to
weiner@atari.archive.umich.edu

Hello,

It should also be mentioned that there is a fully 8-bit emulator for
the ST. You will find it and more information on the STXformer on Atari.archive
I have yet to find an Xformer cable though so if you have any luck, please get
back to me.

>th
>dosh on Lattice C v5 (pretty goo, BTW) I'd rather not have to get another C
>compiler :-)

I have both, g++ and gcc, but I think you dont need the c compiler.
You need as minimum:
g++.ttp the compiler driver
gcc-cc1p.ttp the c++ compiler
gcc-cpp.ttp the preprocessor
gcc-as.ttp the assembler, used to assemble the output of the compiler
gcc-ld.ttp the linker
and the libraries ( C and!! C++ ) and the header-files
I hope this helps.

>this is a rhetorical question.)

Aw, what the hell, my account is expiring soon anyway... :-)

Well, I view Atari from a pessimists' viewpoint so keep that in mind.
Atari's earnings are horrid. The company is in deep debt. Their
products are not selling very well (just read an article that stated
that Portfolio purchases are falling off dramatically too) compared
to the past. With the exception of Portfolio advertising, there
basically is NO ad campaign. Their products are late to market
compared to comparable products from other companies.

What do I think is going to happen? Take a wild guess.

Enjoy all,

Chris

I tried responding via email, but my friendly neighborhood Internet
host said:
550 ralph@prosun.first.gmd.de... Host unknown

Anyway, ARC and UNARC place extracted files into the *current*
directory. If you are running from the GEM Desktop, it's likely that
you have made unarc's or arc's directory the current directory by
topping its window.

Try topping the window where you want the objects to be placed, then
hold down the SHIFT key and double-click on arc.ttp or unarc.ttp in a
background window. That will instruct GEM to run the program without
switching to its directory.

You won't have this problem if you run your archiver from a
command-line shell or special GEM shell.

We do both ftp and BART. (Brode's Archive Retrieval Thang)

>how do we now access it when we don't have FTP access ?.

Good question. Send a message to atari@atari.archive.umich.edu. The body of the message should read "help". BART will send you back a help file that explains everything. Send me a message if you have any questions. I may be a bit spotty on Atari software these days, but I believe that I am eminently qualified to answer BART questions.

Subject: Re: arc602.ttp or unarc.ttp question
Newsgroups: comp.sys.atari.st
In-Reply-To: <727@bigfoot.first.gmd.de>
Organization: Oklahoma State University, Stillwater
Cc:
Bcc:

Easiest way is to use a Shell program (Charles Johnson's ArcShell?)
and set ut up to either create directories or whatever. Other way is
to open the window to your arc program, open a second window to your
desired destination, hold right mouse button down while double clicking on the
arc program (in unselected window). Do what you've been doing at this point.

Most correct way is to enter the command at the .ttp prompt (having done
things the way you've been doing...) "x a:\srcpath\srcfile.arc b:\dstpath*.*"
where a: and b: are the source and dest. drives. and srcpath is the source
files path, srcfile.arc is the arc file, dstpath is the path where you want
to put the files from the archive, and *.* meand extract every file!

Double clicking on arc.ttp and giving the argument "h" (single char) will
usually cause it to tell you how to use it. Good luck.

>So why not give it a try, and then eat your words..

you missed my point entirely...

it does NOT matter how good any particular lharc is. this new one may be the greatest thing since sliced bread. the problem is there are at least 3 widely used existing version (more like 4 or 5, i suspect) which ARE INCOMPATIBLE. and there are .lzh file created by one which CAN'T BE UNPACKED BY ANOTHER. THIS is the problem. even archive maintainers (i have heard from one so far) finally see this as a real problem. there is NO STANDARD FILE FORMAT.

and there is no consistent unix/VMS/whatever source available from a single focal point. this is a hacker's tool now. it is NOT a reliable distribution mechanism for information dissemination like arc, zoo, tar, or whatever. i really don't care if it compresses a 5 MB file to 10 bytes in 5 nanoseconds if i (or MANY PEOPLE) can't unpack it.

no need to eat my words until ALL .lzh files everywhere are converted to this new "hot setup". do you see my point now? if this lharc will 100% guarantee that it will unpack ANY file, i will eat my words. also, i don't want to have to get it by disk. it should be posted, source and all. it's not the $$$ involved, it is the standards issue which i rant/rave about. i would pay $100 for it if it could fill the bill as i described AND more importantly, if we collectively adopted it as THE ONE AND ONLY LHARC IN EXISTENCE...

Hello All,

This is the list of dealers I have received so far.
They are in NO PARTICULAR ORDER, I just append incoming mail
to the end of this document. I did edit some of your mail messages
to keep it short, you can ask the companies questions as to
what they offer exactly. I am not responsible for the accuracy of the
information listed below and I am not in anyway affiliated with any of
the companies. Hope this helps everyone.

!!!!!!!!!!!!!!THANKS TO ALL THOSE WHO CONTRIBUTED!!!!!!!!!!!!!!!

p.s. These companies are located in the United States or Canada, no
overseas companies listed.

AtariVille in San Antonio, TX. phone: (512)736-1405.

Source record: 231320

I moved the file to my Color Computer 3 and used a hexdump utility
to analyze the data and do what I had to do to make it usable.

It worked. In retrospect, I think I turned it into a
"comma separated value" file and read it into MasterPlan. Or I
might have done something else with it. I can't remember. Whatever
I did, I remember it wasn't a particularly difficult problem. But
I laid out the procedure and theory behind what I did so that people
could see that it was the approach that counted and that there were
a number of tools available for the Atari ST or any other computer
that could do the job.

There were a number of very valuable lessons to be learned.
One valuable lesson was that there is NOT an isolated "Atari ST
world" which either survived or died and held us captive. No, not
any more than there is a Color Computer 3 world, the "death" of
which would make my Color Computer 3 "obsolete". Nor were there
specific tools necessary without which I could not get the job done.
Oh, in certainty, I had to have certain classes of capabilities,
such as an ability to look into a file in a Hex dump presentation
or some other way of seeing the ASCII values and binary values,
and possibly some computer language or other tool to modify or
extract data from the file. Also I had to have the ability to
move the data "cleanly" between the two computers. But any number
of tools could do the job, selectable from those broad classes
of tools.

But the magazine I sent it to didn't want it. They *loved*
the article generally, but they wanted me to rewrite it using the
tools available for the Atari ST specifically. They didn't want
people to know that the *approach* was the key. To show that
methodology was so important as to eclipse the brand of computer
you worked on was, well, "too much truth" for their readers.
I agreed to re-write the story. But time being what it was, I
never got it done. It's a pity. They should have printed my
original story. Maybe later people would not have been running
around with their heads cut off moaning the death of the Atari ST.
It's not dead really, but that's another matter. Anyway, I won't
say which of the magazines it was. But they made a choice a long
time ago. They decided to shovel the brown stuff which was
their version of the "truth" about the Atari ST and computers
and software in general. And for the most part, other "fan magazines"
in the computer industry and even in other industries, are about
as bad. And now they, and many others like them are gone. So what
I think I've seen over the years is that people pretty much get what

they deserve.

It's not likely that I'll ever be a publisher in the professional sense. I've put out "newsletter" in the past, but I'd really rather be writing or drawing, or even researching, than doing the paste-ups and all the other details of publishing. So I'm writing this with the hope that maybe someday someone will make it into the publishing side, and keep it in mind. Maybe you don't have to squeeze the truth through some strained filter after all. Maybe doing so isn't going to help you as much as you think. Maybe in the long run, your magazine might even last longer if you aim for higher standards. And maybe it won't. But then when it's over, at the very least, you will be able to say, "I told the truth."

A long while back when the Atari ST was strong I wrote a magazine article. As is typical for me, it was an unusual article. I started with a datafile which came from MS-DOS (dBASE III) which wasn't being accepted by the programs I had available. To do so I moved the file to my Color Computer 3 and used a hexdump utility to analyze the data and do what I had to do to make it usable.

It worked. In retrospect, I think I turned it into a "comma separated value" file and read it into MasterPlan. Or I might have done something else with it. I can't remember. Whatever I did, I remember it wasn't a particularly difficult problem. But I laid out the procedure and theory behind what I did so that people could see that it was the approach that counted and that there were a number of tools available for the Atari ST or any other computer that could do the job.

There were a number of very valuable lessons to be learned. One valuable lesson was that there is NOT an isolated "Atari ST world" which either survived or died and held us captive. No, not any more than there is a Color Computer 3 world, the "death" of which would make my Color Computer 3 "obsolete". I've never really tried it yet, Brian, but I recall that ST Writer lets
you call in AtariWriter files via a modem line (?). You would probably
need an 850 interface to do it. I'm sorry but that is all I can offer.
Perhaps someone else would know more about that than I would.

P.S. Could you perhaps tell me how I can contact James Randi?

If my memory serves me right, STart published a program (with source)
that converts CAD 3D files to DXF format. I don't have the issue handy
at the moment but I think it must be around two years ago, when I had a
subscription.

Dave Small was quoted in the latest STReport that he was working on
fixing it and didn't expect too much of a problem.

266. Mega30 Fan

Newsgroup: comp.sys.atari.st
Date: 1991-06-08 03:06:10 UTC
From: NCOYNE@ESOC.BITNET
Message-ID: <91159.025501NCOYNE@ESOC.BITNET>
Source record: 231315

Hi heres some info my friend provided on the modifications he made to his
Mega file 30

0660103030566
9[.... ....]
Atari Megafile Mods.

If you are slowly going deaf from the noise of your Atari
Megafile, the following might help a bit, but be warned it isn't a
super mod: the fan noise doesn't suddenly stop, just gets reduced
a bit .....
The fan mounting, and the outer case of the Megafile severely
restrict the airflow from the fan. If you take the top off the
Megafile (Park the hard-disk first), you'll find that the fan can
be lifted out, and if you run it with free air flow, it doesn't
make much noise. I cut away the metal mount so it didn't obstruct
the airflow, and also cut away the plastic grill in the Megafile
case, and enlarged the resulting hole so that it didn't obstruct
the airflow. I made up a small wire grill which I screwed to the
outside of the case to stop me poking my fingers in by mistake.

I don't recommend using an internal temperature sensor and
turn the fan off until its needed, because unless you use several
distributed sensors, there is a risk of local 'hotspots'
occurring, which are not detected by the sensors. Incidentally,
without a fan at all, the disk drive gets hot after long use. It
may still work, but this has to shorten its life.....

When I bought my Megafile, it was for use with a 1040ST. The
DMA cable as supplied is obviously intended to be used with the
MegaST range, and will not reach the 1040's DMA connector. I took
the risk, and made up a new screened cable about 1 metre long,
which has been working with no problems for about two years now,
with no errors due to noise, fatal predictions from friends, etc.

I also had a second, external floppy drive, but things where
getting a bit like the early Atari ST days, with cables
everywhere, and my desk wasn't big enough. When I took the top off
the Megafile, I found there was enough room inside to hold the
second floppy. (One of the slimline NEC types with a 5V supply). I
removed the small board carrying the LEDS indicating disk
activity, and cut a hole in the front of the Megafile case to
allow the diskdrive to fit closely, then mounted it inside the
bottom of the case with a couple of small metal brackets, and
mounted the LED board between the drive and the edge of the case
with another bracket.

I was able to fit a 15 pin D-type connector at the rear of
the Megafile case, between the power supply switch and the edge of
the case, outside the metal screen, and connect this to the drive
with a short length of screened cable. (The disk data interface
is standard Shugart). I know a 15 pin 'D' connector isn't
standard, but who else is going to use my drive with another
computer?. Anyway, this was the only connector I could find with
enough pins that would fit in the space....
The +5V for the drive was tapped from the Megafile internal
supply. If the cover is removed, there are 4 (I think) terminals
towards the front right of the power unit. Two are ground, one is
12V and the other is 5V. (Use a test meter !!). The Power unit
can easily supply the low current theses slimline drives need.
Mine has been operating OK for two years now.

The above info was provided by a friend.

267. Appending Files with GEMDOS...

Newsgroup: comp.sys.atari.st
Date: 1991-06-08 04:32:23 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <o5g832w164w@ersys.edmonton.ab.ca>
Source record: 231334

Does anyone know how to use the GEMDOS File commands to open a file for a
ppending. I have been trying using Personal Pascal, but that is a weak
spot for the language, so I have decided to try to use the GEMDOS
commands (F_Open, F_Close, F_Seek, etc.) to do the job.

Can anyone help?

268. And yet more 520ST info wanted

Newsgroup: comp.sys.atari.st
Date: 1991-06-08 04:47:55 UTC
From: Azog-Thoth@cup.portal.com
Message-ID: <43082@cup.portal.com>
Source record: 231308

A coupla weeks ago, I got a 520 STfm, and after using it, Ive more questions to ask about it...

I know the memory can be upgraded, people have told me so, and I also opened up the case, and saw an unpopulated bank of memory. What I need to know is the value of the caps that I also need to add, so I can populate this bank with the 256k chips.

On that same note, Ive heard that you can get 4mb of RAM, but I dont quite see how. There are no SIMMs or SIPP sockets to hold the larger memory modules.

Anyways. I found out that the version of TOS I have is 1.0. I guess that this is stored in the ROM. Anyway of upgrading to 1.4? Also, what is the difference between 1.0 and 1.4? Any benifit of upgrading? And since its on my mind :-) Just what does TOS stand for anyways?

Thanx, even tho Im sure that Ive repeated questions thats been asked many times

269. path to Gadgets

Newsgroup: comp.sys.atari.st
Date: 1991-06-08 06:54:13 UTC
From: root@gbs.UUCP
Message-ID: <165@gbs.UUCP>
Source record: 231365

The path taken by this message is the path "back" to us here at Gadgets. Our machine name is "gbs" as a 7-character name ("gadgets") was causing some problems along the line. I'm "dsmall" here, or "root". The machine is an AT&T 3B1 (7300).

The newsfeeds seem to be operating fairly stabley (is that a word?) now.

Anyway, since I can't get to the Well machine as often as I'd like, and this machine is much closer (10 feet vs. 2000 miles), I thought I would mention it. I'm open for GCR, SST, MegaTalk, and automatic weapon discussions (*grin*).

Gadgets by Small / bottlewasher

270. System 7 on the GCR (from dsmall)

Newsgroup: comp.sys.atari.st
Date: 1991-06-08 07:07:31 UTC
From: root@gbs.UUCP
Message-ID: <166@gbs.UUCP>
Source record: 231363

We've tested (and tested, and tested) the final release Sys 7
on the GCR, and nope, it doesn't work yet. I wouldn't sweat
this one too hard; I can recall both systems 6.0.3 and 6.0.5
needing a helping crutch to get them going, too. The problem
seems straightforward and we're working on it, but you never
know if you've got ALL the problems fixed until it runs.

I certainly found the following code fragment creative:

move.l (a7)+,$fffffffe

Near as I can tell, someone wanted the low word off the
current stack long into locations 0 and 1.

nice.

(And yes, I know how many things that breaks...)

Anywho. Back to the salt mines, and I'll let you know when
we have it functioning.

Incidentally, we're seeing reports of some TT's not running
with GCR. Move the GCR to another TT, it runs. One known problem is
putting a monitor on top of the TT; the monitor generates enough interference
in the internal floppy to damp out the disk signal. Solution: move
monitor backwards. Another problem we are hearing reports of, but have
not gotten into the lab yet, is GCR's having cartridge port troubles.
We have no idea what that is (low +5 at cart? Timing changes? You got me...)
but are trying to find a non-working GCR/TT to look at and find out.

If you're curious, the plan at the moment is to add LAN and
internal SCSI drive support to the TT; hopefully this will superset to
generic SCSI support for the TT, so about any Mac SCSI peripheral will
plug in (if you follow the termination rules -- I wonder what Atari did.
Good question, that -- you know, Allan?) However, SST is getting
priority at the moment. We also hope to support LAN (Appletalk/Localtalk,(tm))
on the MegaSTE.

MegaTalk had a production run of PC boards without plated feedthrus.
100% rejects. That slowed things down. SST h/w is done and we're in the
thousand-and-one details of ramping up production; I'm wrapping up some
interesting compatibility software for it, so lots of things that normally
break on 68030's will work.

Anywho, back to the salt mines. (And I hope this post makes it
out; getting this link working through two quirky machines is... interesting.)

-- thanks, Dave Small

271. Re: TT ram revisited

Newsgroup: comp.sys.atari.st
Date: 1991-06-08 08:23:23 UTC
From: mbaker@ucs.adelaide.edu.au
Message-ID: <3590@sirius.ucs.adelaide.edu.au>
Source record: 231328

From article <meulenbr.676276267@cstw163>, by meulenbr@cst.prl.philips.nl (Frans Meulenbroeks):
> Hi,

Hi... :)

> Also I found out that the TT ram is 100ns ram. I do not have any 68030
> doc handy, but with a 32 Mhz clock, I think at least one (and very maybe 2)
> wait states will be required to access this memory.
> Would it be technically feasible to replace this memory with faster
> memory, and get rid of this wait state? Will 80 ns be enough to get rid
> of the wait state, or should 60 ns be used??

At the risk of making a fool of myself, I should call to notice the fact that most larger Intel-powered systems use 70 or 80ns DRAMs, with similar clock speeds. Even these chips aren't fast enough to keep up with the CPU. Various techniques are used to ensure that, most of the time, the same DRAM is not read twice in two machine cycles... on the rare occurence that it is, a wait state is inserted... - thus, you get quotes of 0.01 wait states, etc.

> Since, if I'm not mistaken, the 68030 requires at least 3 clock cycles to
> do a memory access. So removing a wait cycle would speed up the memory
> access from 4 to 3 cycles. which would (in theory) lead to a speed
> gain of something like 25 %. Now of course not all cpu activity is
> memory access, so perhaps this figure is on the high side, but it seems
> to me that a substantial gain could be obtained here.

Not being sure of the exact details for the '030, but with the 000 and 010 there are 4 clock cycles between /AS and the first scan for /DTACK. As I said, if the memory architecture is properly designed, in most instances, the memory will be capable of responding immediately.

Any comments from those more familiar with the 030 and the TT's architecture are welcome...

Indeed this is no misprint. The problem lies in the fact that the address
ADDMEM uses is not documented. (Sorry, but I don't think you can get the
MPB address legally.)
If you use another TOS-version than the german 3.01 ADDMEM as printed in
ST Computer won't work. I think the best way to find the missing address is
to use SYS_MON.
BTW, the correct address for the german TOS 3.05 will follow next week.

>- Is this rumour true?
>and if so:
>- Has there been mentioned anything about the time frame in which this
> should occur?
>- will it be possible to upgrade current TT's?

With the TT and MegaSTE-versions delivered in the moment you can use a HD
floppy drive right from the start, you have just to plug it in.
If you use HD discs in this drive, TOS first recognizes a read error. It
automatically switches the speed of the floppy controller to 16 MHz and tries
again. So some kind of the hardware presented in ST Computer 1/90 (HD drives
for the ST) is built in.
Nevertheless I found two problems. My controller doesn't work correctly with
HD discs if the machine has warmed up. Apparently the controller doesn't like
16 MHz too much. If you use programs like ROMRAM or ROMSPEED you get problems
writing on these discs. It seems as if this is a timing problem, because after
moving the rom to the fast ram the floppy subroutines of TOS are to fast and
report a timeout.
To get a button "High Density" in the desktop format dialogue you have to set
configuration switch #6 to ON. Selecting this button to format a HD disc fails
on TOS 3.01 but wait for TOS 3.05 ...

The Mtools package is not just a driver for the floppy drive. It is a
collection of MS-DOS style utilities which allow you to read, write, make
directoried, cd, change attributes, etc. It is much easier to use than
the canned stuff Sun provides. Also, the Sun stuff is incredibly picky
about formatting floppies. If it gets just one error, it totally aborts.
I would advise formatting on a PC or your ST, and if you can compile Mtools
use it. It is really nice.

Others have mentioned the "mtools" package. It can be obtained by ftp
from cerl.cecer.army.mil and works quite well.

If you are running SunOS version 4.1, then you have another option.
SunOS now supports MS-DOS file systems. The file system type is
called "pcfs", and it is used with the normal Unix commands, e.g.,
"mount" to mount it, "ls" to list the directory, etc. Since mount
normally requires root privileges, you might need your system
administrator to provide a trivial setuid root program to call mount
with the appropriate arguments. Also, an appropriate entry must be
made in /etc/fstab.

Well from what I have read, its only the CPU that runs at 32 mhz, the
other bits (buss) runs at 16 mhz.
Is it not the same as these 16 mhz Turbo options for the ST, you still keep
you standard Rams and Roms, ie, only the CPU runs at that speed ?.

284. Memory location of MPB

Newsgroup: comp.sys.atari.st
Date: 1991-06-09 11:58:51 UTC
From: seimet@rhrk.uni-kl.de
Message-ID: <1991Jun9.115851.19753@rhrk.uni-kl.de>
Source record: 231344

For those who need the memory location of the MPB in the german versions of TOS (e.g. for the use with ADDMEM) here they are:

TOS 3.01 (08/09/90): $71E2
TOS 3.01 (08/29/90): $71E2
TOS 3.05 (12/05/90): $70E8

Keep in mind that these addresses are not documented. They may be different for other version of TOS but I expect them to be located near the addresses above.

285. MiNT Minix filesystem problems ...

Newsgroup: comp.sys.atari.st
Date: 1991-06-09 14:54:33 UTC
From: olorin@tardis.computer-science.edinburgh.ac.uk
Message-ID: <9106110042.AA08858@ucbvax.Berkeley.EDU>
Source record: 231387

Will anyone who has been experiencing problems with the minix filesystem
for MiNT 0.8 please mail me full info , this site has been known to miss
the occasional post or two,so mailing me is the only sure way to let me
know , so that any problems can be fixed.
By 'problem' I mean anything no matter how trivial , I am
particularly interested in anything that makes 'fsck' complain , non
recognition of minix partitions , disk-change problems , logical
partition problems (this should be OK now unless the minix partition
uses >1K sectors or any partition has >8K logical sectors).
I have not succeded in making fsck complain with my setup , ICD
drive and STE with TOS 1.6 , if you find a way then please tell me ,
1. What commands caused the problem .
2. What fsck reports (that is minix fsck not a TOS version!!!).
3. Any debugging output (if possible).
4. Your hardware , that is drive and driver software type and version of TOS.
5. Any other info you think may be useful.

Any other kinds of comments are welcomed , such as patches ,
suggestions and flames (if you must) .

P.S. May I reiterate the comments in the docs , don't try using
minix partitions unless you are sure you know what you are doing. If you
think its a good idea to run TOS filesystem consistency checkers on
minix partitions then you *don't* know what you are doing :-)

```

Message-ID: <9JUN91143025@uavax0.ccit.arizona.edu>
Source record: 231345

Is it possible to restore an image backup of a partition after changing the interleave of that partition? I changed the interleave on my drive from 3 to 2 (it seemed to give faster access), but I am having trouble restoring the image backups that I made. If it matters, tha backups were made with the Michtron Toolkit program. I have experienced a lot of unreliabllity with that program in general, and I don't think I will use it anymore. Can anybody recommend another program with similar features (at least the backup features)?

Doug
I9853100@ccit.arizona.edu

287. Re: FSM-GDOS...When? How?

longj@lonex.radc.af.mil (Jeffrey K. Long) has 4 questions about FSM GDOS:

No, FSM GDOS has not been released yet. Atari is saying 6 weeks, but they have been saying this for quite some time now.

Yes, the newest beta versions that we have, do include drivers for the HP laser printers.

No, Goldleaf can not ship FSM until it is released by Atari. But owners of Wordflair II will be the fist ones to hear about the upgrade and will be able to purchase it through Goldleaf.

288. Modem - send fax

Newsgroup: comp.sys.atari.st
Date: 1991-06-09 19:49:34 UTC
From: lchd_ltd@uhura.cc.rochester.edu
Message-ID: <14408@ur-cc.UUCP>
Source record: 231346

Thanks a lot to those who have emailed me about my question about
modem recently. Now I have one more question. I found that some
of the pc's modems come with Send-Fax capability. Could Atari ST
make use of this function (can ST send fax with these modem)?
If I have a Spectre GCR or any IBM emulators, can I use Mac and
IBM fax softwares to send fax? I came across a fax-modem by
Public Domain Corporation which they came that we can send fax
if we have Spectre GCR or and IBM emulator like AT-Speed. So is
this PDC modem same as those pc's modems that have send fax function?

Thanks in advance.

...

What you have is 2.5Mb of RAM with the last 512K duplicated 4 times. Your machine thinks it has 4Mb. If you create a 2Mb RAM disk that sits in low RAM then use your machine you'll see weird behaviour as the multiple images get used. You need a little patch program that checks phystop and the memory controller at bootup andif it's 4Mb set it to 2.5Mb then reboot.

Actually what we all need is for Atari to fix the &^%*$ ROMs!

Does TOS 1.62 have the same problem?

Well this Bob Dobbs character (actually 4) is just another example of Atari wastage, along with Bea Hablig et al. I think I would have preferred to see four box corner characters, ala IBM, so that we could make up boxes in text.

Now some bright spark is going to say "Why not change the font youself". Why should I have to support 3 resolution (6 if you include the TT) to get such a simple addition. Atari should have put something *useful* in there in the first place.

Yes. There exists an autoboot program named SIMMFIX.
The ONLY thing it does is check if the computer THINKS it has 4 MB
and the MMU says it has 2.5MB. Then, it sets the MEMTOP correctly,
and reboots.
^^^^^^^
- several descriptions are around of what happens then.
Some get bombs, some don't, my computer didn't do anything,
that is, the memtop wasn't corrected at all. I rewrote the
program: it jumped to the hd_init vector (or something sounding
alike) in stead of taking the real reset vector, which had the
effect that my machine (with no Hard Disk) did not reset. I changed
this, and it worked fine.

If I'm talking nonsense, please state so on the news. If someone's interested,
do the same, by mail. At this moment, my STE is at the manufacturer for the famous
HD-problem (problem #2 :-/) for some months already. I have not had the opportunity
to test anything I said here.

296. man w/ pipe

Newsgroup: comp.sys.atari.st
Date: 1991-06-10 08:51:21 UTC
From: S_DINGLER@iravcl.ira.uka.de
Message-ID: <1991Jun10.075302.2611@ira.uka.de>
Source record: 231351

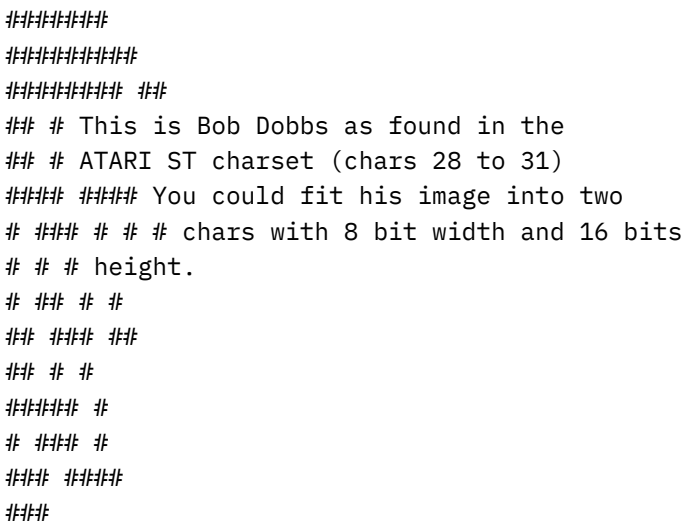
Hi folks!

This is what I found out about that man with the pipe. Thanks to all who answered my question. I included a picture of Bob (see below). Its is the bit image graphics of the 4 ATARI ST chars (28 to 31).

Hey, that's Bob Dobbs, leader of the Church of the Sub-Genius.
Slack off! Quit your job! Send your money to Bob!!

Bob is indeed a special person, being the revered icon of the Church of the Sub-Genius.

Consult your weirdest bookstore for details.
Or join newsgroup alt.slack. and ask for details...



This is Bob Dobbs as found in the
ATARI ST charset (chars 28 to 31)
You could fit his image into two
chars with 8 bit width and 16 bits
height.

299. The Ultimate Atari ST System, 4 Sale

Newsgroup: comp.sys.atari.st
Date: 1991-06-10 09:22:21 UTC
From: jeffk@sgi.com
Message-ID: <1991Jun10.092221.3244@odin.corp.sgi.com>
Source record: 231352

I have the following items for sale:

Hardware:
Atari Mega ST2 (upgraded to 4 megs, w/TOS 1.04, socketed cpu, Best PowerSupply)
MoniTerm Viking 2/91 high Resolution monitor (1280x960) w/controller card
Atari SC1224 colour monitor
Atari SM124 monochrome monitor
SyQuest 44 Megabyte removable cartridge Harddisk w/case, ps, ICD Advantage plus
Wuztek D.E.K.A. PC keyboard interface
Northgate Omni 102 PC Keyboard
Practical Solutions Cordless Mouse, Monitor Master, Video Key
Gadgets-by-Small Spectre 128 w/ROMs (Version 3 software)
Talon SuperCharger w/1 megabyte and power supply (PC emulator)

Software:
NeoDesk 3
STalker/STeno
Flash!
WordPerfect
PageStream
UIS III
MultiDesk
Assorted Games

I'd like to get $2695 for the entire listing but, if nobody offers me that, I will entertain bids for the various pieces of equipment. Send me an e-mail with your bid. The highest reasonable bid (by June 30, 1991) will take the bidded item. Send bids and inquires to: jeffk@sgi.com

Thank you for reading this message. (This is my first posting to News so I hope I did it correctly. :-))

302. G++ at A.A. from ftp.thp.koeln.de

Newsgroup: comp.sys.atari.st
Date: 1991-06-10 09:46:36 UTC
From: gjh@hplb.hpl.hp.com
Message-ID: <GJH.91Jun10104636@ghiggins.hpl.hp.com>
Source record: 231359

This archive has been withdrawn from A.A. following an adverse report which indicates that the archive's integrity has been compromised.

G++ is case-sensitive to its support files, apparently the archive prog blithely switched them all to upper case.

The lack of documentation, author identification and sources only add to the problem.

BTW --- This seems to be another example promoting the argument for compressed tar files.

>here it goes: Does anyone know of any type of X-Window
>emulation/server/host for the ST? Please either e-mail or post
>replies!

There is!
I have seen it on the c-bit this year.
It was a st with x-win connected to a unix-tt.
But it was not working too good. :-(
As far as I seen it....

On the other hand there is a programm called UW (unix windows).

I think it was designed for the mac first, but it has been
ported to the st by someone.

After typing *UW* in the first window the host starts Unix-Windows and
from now on you can use, I think about 6, windows.
So I am able to work at different suns at the same time......
Thats fun :-)
(So my st could "have" 100 MIP's ore more...)

so long

304. A.A. : ~ftp/atari/gnustuff Ground Under Repair.

Newsgroup: comp.sys.atari.st
Date: 1991-06-10 09:57:16 UTC
From: gjh@hplb.hpl.hp.com
Message-ID: <GJH.91Jun10105716@ghiggins.hpl.hp.com>
Source record: 231360

I am trying to clean up the gnustuff directory on A.A. I will try and create an A.A.-hosted GCC cros-compiler, so that A.A. has binaries for the most recent patches.

The most notable problem is that A.A. does not have the ST-specific diffs to create the ST port of GCC 1.39 --- we have only binaries.

Other (example) problems are:

util.zoo --- has nm.c from the Sozobon distribution and a spurious Patchlevel (14, should be either 13 or 15).

include.zoo --- does not include math.h nor stab.def

Here are the current Patchlevels of the central ST versions of GNU sources at A.A.

curses.zoo - PathLevel: 7 (sic)
flex.zoo - no patchlevel included
gemlib.zoo - PathLevel: 15 (sic)
include.zoo - PatchLevel: 62
libsrc.zoo - PathLevel: 62 (sic)
pmlsrc.zoo - PathLevel: 8 (sic)
util.zoo - PathLevel: 14 (sic)

I'd be grateful for uploads of verifiable later versions of any of the above sources and also verifiable sources (diffs from FSF distribution) for GCC 1.39.

305. Reading TOS/DOS diskette on the SparcStation

Newsgroup: comp.sys.atari.st
Date: 1991-06-10 10:20:15 UTC
From: M.A.Rahin@lut.ac.uk
Message-ID: <1991Jun10.102015.18976@lut.ac.uk>
Source record: 231357

Following my earlier query on this subject, I had quite a few responses. Thanks very much to all who responded. For those who might need the summary here it is.

Mtools is a suite of package on the SparcStation that allows reading/writing TOS/DOS formatted 3.5" diskettes. The complete package along with the patch files can be obtained from the following anonymous FTP sites :

1. cs.uni-sb.de (134.96.7.254) - directory : pub/sun/mtools
2. cs.uba.ca (137.82.8.5) - directory : src
3. cerl.cecer.army.mil (129.229.1.101) - pub/mtools

Finally, thanks again to those who responded. I really appreciate your help.

- Rahin

309. GCC -g and G++ bogon alert!?!

Newsgroup: comp.sys.atari.st
Date: 1991-06-10 12:04:04 UTC
From: hess@rospc1.informatik.uni-hamburg.de
Message-ID: <hess.676555444@rospc1>
Source record: 231355

Hello,

I have a problem with the gcc 1.39 and the g++ from the koeln ftp site.
If I try to compile the following program with g++:

```
#include<stream.h>
int main(){ cout << "Hello World\n"; }
```

All works niecly until the link run. Then the linker says: Bogon alert: wrote xxx Symbols, yyy expected. And the resulting file is not a TOS executable (TOS error 66: not an executable program).

The same happens, when I compile a normal gcc program with the gdb option "-g". Then there is another number of wrote/expected symbols, but the resulting program again is not executable.

Has anyone encountered this problem and perhaps already solved it?

Hauke Hess / University Hamburg (so write in german, if you like)

Unix Windows is not related to X in any way (other than coincidental appearance). It is a great program, which allows one to have muliplexed terminals over one serial line (the terminals are in the form of windows). You can set font sizes, cut and paste, file transfer, etc. It consists of an ST end and a Unix end (which must be compiled for your particular system). I have found that it works great, but is a bit pokey at 2400 (I am waiting for my 9600, zooom). Basically, it acts as a regular terminal program (you dial up, get one terminal window). At that point, you run the unix end (from the initial terminal window). After a few magical packets get transfered back and forth, you can now open more windows, each served by their own login shell. There are at least two versions of the UW package for the ST (I have two). One is more fancy, but less tolerant of accs and tsrs (the port appears european in origin). The other (this one is on atari.archive) has fewer bells and whistles, but is solid (on my system at least).

As for an X server on the ST line, I don't envision it happening any time soon. With Ethernet cards so scarce, and 9600 baud modems still in the $500 range there is not a very high demand for one. Don't get me wrong, I would love to have one (and if you find out about one, I will be happy to eat my words). You could probably direct-connect the serial port and run it at 19.2 using a SLIP connection.

```

If the cpu need to read data, it is done in burst modus. This means that the cpu reads the first long word in two cycles and the next three long words in three cycles. You will only speed up writing to memory if you replace the memory card with a faster one. There are some third party ram cards which are faster than Ataris, but I don't know nothing about these cards.

The Developer's Kit is a workbench which supports ALL Prospero languages and floating point libraries. Additionally, a CLI and some tools are delivered, where the most important is the `make' utility. You can also define startup- and batch-files.

> the first place.

Darnded right! Atari really screwed up. Why didn't they use the IBM character set like a REAL computer would? Come to think of it, why isn't the Atari ST an IBM compatible computer? Gosh, it makes me so mad to think of the large number of *useful* things that could have been done with the ST if only it'd been an IBM compatible.

Grow up. There wasn't an official standard for all 256 characters back in '85 -- and there still isn't today. It's only a waste if you believe you *deserve* more than what you supposedly purchased with eyes wide open.

From: Paul_Thompson@mindlink.bc.ca
Message-ID: <6201@mindlink.bc.ca>
Source record: 231175

I am thinking about buying a 1040ste because I like the music software. (I do sequencing of electronic music and have sold two albums so far.) I'd like to get people's opinions on the Atari as a music machine and opinions on the music and other software for it. My general question is: does the Atari software in most fields match that of IBM &/or Mac?
Also, I have the possibility of buying the STe with a laser printer. Do Atari laser printers work ONLY with Atari machines? Are they really good?
Your comments on what's what in the Atari world will be warmly welcomed and carefully read. Thankyou in advance.
Paul.

This is a reply I got a few months back re: Prospero Software and versions.

Bob

Originator: prosof@compulink.co.uk
Subject: Re: Updates

The latest versions are 2.153 for Fortran, and 1.144 for C. Both fix
all known 'incompatibilities' that occurred with TOS 1.4

The cost of updating to the current versions is 30 UK pounds, and the
master disks will need to be returned with payment (either by a
cheque drawn on a UK bank or by credit card) to the address below.

Regards
Paul Hargreaves.

318. Z-RAM made drive go nuts! WHY!!??

Newsgroup: comp.sys.atari.st
Date: 1991-06-10 16:08:19 UTC
From: d90-ngp@sm.luth.se
Message-ID: <1674@tau.sm.luth.se>
Source record: 231397
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have upgraded my 1040 STFM to 4 megabytes with Z-RAM. My ST was one of those with soldered MMU-chip, so I let a proffessional do it for me. When I got my ST back I ran the test program. Geee, four megabytes and no complaints! I started to install Neodesk 3, reads files from one disk and started writing on another. Then suddenly the drive starts making noise. It sounds as if the drives' motor tries to move the head right through the side of the machine. Two dialog boxes explains that the drive does not answer and that the disk is full, although it has 800 kilobytes free!!! A couple of minutes later I conclude that MY DRIVE READS AND FORMATS DISKS IN ALL POSSIBLE COMBINATIONS OF SECTORS AND TRACKS, TWISTED AND NOT TWISTED, FROM GEM, FROM NEODESK 2.05 AND FROM ALL PROGAMS THAT I HAVE BUT IT CANNOT WRITE MORE THAN A COUPLE OF KILOBYTES ON ANY DISK!!!

Now I am in desperate need of HELP!!! The proffessional will do his best to fix it, but it would probably go much faster if anyone have had this problem before and can give me any clue where to start dig. You cannot be to detailed.

DETAILED DESCRIPTION OF A FEW MINUTES EXPERIMENTING
==========
Equipment: 1040 STFM, monochrome monitor, Z-RAM and nothing more!

Inside Neodesk 2.05:
Trying to write to an empty disk formated before memory upgrade.
Drive writes some 10 K, makes noise, dialog boxes sais: Drive not responding.
Disk full.
I cancel writing, "Show info..." sais more than 800 K free.

Same test and same result again a couple of times.
Formats disk in different ways, same test, same result.
Try to load First Word +, Neodesk responds:

An address error has occured (3 bombs).

System register:

d0: 00000800 a0: 000030C2
d1: FFFF0F0F a1: 00008092

instr: 3D6D
sr: 2300={t:0 s:1 interrupt: 011 x:0 n:0 z:0 v:0 c:0}
pc: 00FC60EA

I pressed return, a fourth bomb showed up, all went black and the computer rebooted.
I started Neodesk 2.05 again and then loaded 1st Word +, no problems!
Loaded a rather large document, changed to empty disk and tried to save.
Disk wrote some 10 seconds, then made that uggly noise again followed by dialog boxes telling drive don't answer and (the empty) disk full.
I cancelled. Drive made noise, same boxes. Cancelled again etc.

I reset the computer, made the 1st Word + test again from GEM, computer loads program and behaves as before.

Loaded Calamus (from Neodesk), played around a little. Rubberband boxes sometimes leave sides of the box unerased when changing size, in a way I never have seen before. "Show statistics" tell me that I have 3.3 meg free.
Suddenly... 2 bombs! Crash is so hard that even Neodesk got stuck (never happened before).

I GIVE UP.

I have used UW many times but there is one thing about it that really
BOTHERS me. The mouse cursor is always displayed, so that it flickers
and slows down the screen. Now, I wish someone would hack the ST side
of the code to turn off the mouse cursor until the mouse is moved or one
of the mous buttons are pressed (like Uniterm does). This would
significantly speed up the screen too... and it would be much less
annoying... I don't have a C compiler to even thing about it....

The Problem is , that the linker does not handle the DRI-compatible symboltable in the correct way, so try using the -s option to advice the linker to strip off the symboltable.

Bye the way, I've got the stuff from koeln, too, and I dont have that problem; maybe you are not using the linker provided in the package in the cs-directory at the site.

Ladies and gentlemen,

after some of you guys asked for german docs for the Turboass, i wrote
to Markus Fritze for details. Just a minute ago I received his answer.
He said, some guy from Canada had asked for them just a while ago and he
he is just translating the docs and the program to your difficult language.

I will call again, when his work is done.

Bye....Michael

root@gbs.UUCP (Root) (really Dave Small) writes ...]

> The path taken by this message is the path "back" to us here at
> Gadgets.

Just one quick word of advice before you use the Path: line, though.

Put your noggin into action and determine the *closest* site to gbs
that your system knows how to reach. Send mail there. Reasons:

-- Usenet news paths are rarely the quickest routes.
-- Not all systems named in Usenet paths handle mail. (Really!) Using
the Path: line without careful thought is a good way to lose mail.
-- Sending email through systems you don't own is a privilege, and it's
your responsibility to ensure that you don't impose on any more sites
than is necessary. Be a good guest.

>From the 12-hop Path: line on the article I received, I would guess that
ncar.ucar.edu!boulder!tcr!gbs!root might be a working UUCP path, but
there probably is a faster one (anybody know the Internet equivalent of
boulder?)

>Limsico@Ocf.Berkeley.Edu

X-Window-Server for ATARI ST/TT

Two german companies developed an X-Window-server for the
MC680X0-based ATARIs.
The one which I tested from the company X/software has been
sold to ATARI Deutschland GmbH.
It was very slow on the Mega ST, which was connected through
Ethernet to a Workstation-Network.
It worked (except few crashes) even with loadable X-fonts.
But for professional use not recommended, maybe on TT
I could get better results, but at that time was neither
a TT nor a VME-network-card available.
This X-Window-Server is offered now (last CeBIT'91) by
the german ATARI subsidiary.
(incl. Mega-bus/VME-bus network interface)...
The other solution is offered by the company BioData GmbH,
the manufacturer of BioNet (I think the most reliable
network system in ST/TT environment).
To this X-Window-Server I cannot give any statement, because
I never got the chance to test it.
From hardware side I can recommend BioNet, because it is one
of the few products, which allows network connectivity to
other ST/TT, PC, Mac and Unix (incl. FTP, Telnet, etc.).
BioNet is an external network interface with Ethernet (thick/thin)
and DMA (in/out) used by many german professionals companies.

|>
|> I too would benefit from this information.
|> -- Kenn Goutal
|>

I tried using Mtools but never got the Mtools' mcopy to work. Our system admin guy set up pcfs (do a man pcfs). I now use fdformat to format the floppy on the sparc and then mount /pcfs . After the floppy file system is mounted you can do any unix-thing you want - ls, cp, df, rm, mkdir, whatever and the Atari reads these disks without a hitch.

Only glitch is you must be root to do a mount - at least here you do.

Bob Malay

PS I got a copy of unix-version of lharc. Compiled it on the sparc. I now un-lharc at blinding speeds and copy the un-lharc'ed files to the sparc floppy disk!

327. set-up for Practical Peripherals 9600 modem?

Newsgroup: comp.sys.atari.st
Date: 1991-06-10 20:00:56 UTC
From: saj@chinet.chi.il.us
Message-ID: <1991Jun10.200056.29446@chinet.chi.il.us>
Source record: 231386

Over the weekend, I got a Practical Peripherals V.32 V.42 V.42bis modem (at a warehouse sale: wholesale on these babies appears to be about $400). Works just fine, thank-you on my ST so far. I remember some discussion about flow control (or lack of it) with the ST's serial port. Modems like this were 3 times as expensive back then, so I didn't save the messages. What do I have to do? What might go wrong? How do I deal with problems? All this specifically relating to flow control and a fast modem with data compression.
Steve saj@chinet.chi.il.us

I'm interested in hearing from people who have bought or sold
hardware or software via the net. Were your experience(s) generally
favorable? How did you handle the exchange of $$$ and merchandise?
For example, I'd be wary of shipping off a computer with no check in hand,
yet similarly, I'd be wary of sending out several hundred dollars
without even seeing the system. What's worked for you? How were
problems resolved - (gee, that hard drive worked fine when I sent it...)?

Please E-mail replies, I'll summarize. Seems like it would be a useful
addition to the monthly postings... (How to buy/sell on the net)

MiNT is a Multi-Tasking program for the Atari ST. I have tried using it, but it is difficult unless you have MGR, which is a program that manages the multi-tasking. Since I couldn't locate this program, I gave up on the entire ting. You need about 2-4 Megs to use it seriously, though. Or at least that is what I have been told. 1 Meg isn't enough to do anything useful. The program (MiNT) is able to Multi-Task TOS and TTP programs, and keep them running even while a GEM application is running. It won't multi-task GEM programs, but it will let you run one while other things are running in the background. If you have enough memory, and can locate MGR (or really like command lines) then try to get MiNT. Once you get it running, it is supposed to be great...

336. CANNON Bubble jet printer

Newsgroup: comp.sys.atari.st
Date: 1991-06-11 02:51:28 UTC
From: ecc_foley@ecc.tased.oz.au
Message-ID: <1991Jun11.125128.268@ecc.tased.oz.au>
Source record: 231269

Hello All,
Does anybody have any experience with the Cannon Bj 10e bubble jet printer. The reviews I have read say that it is has a very high quality print out (400 d.p.i) is very cheap ($800 Aust), noisy and slow (110 c.p.i). It also said tha it wasn't EPSON compatible. Most of my Atari work revolves around the C-Lab Notator music package, and I am looking for a high quality printer to use to print out music scores. Has anybody used the Bj 10 e with an Atari before i.e. does anybody have a printer driver for it ?

Many Thanks

337. Neo Desk 3

Newsgroup: comp.sys.atari.st
Date: 1991-06-11 04:17:18 UTC
From: Azog-Thoth@cup.portal.com
Message-ID: <43160@cup.portal.com>
Source record: 231385

I just ordered Neo Desk 3 today (cant recall the publisher) and am just looking to see if anyone has any opinions on it. It looks pretty good in the ad (which is why I ordered it:-), but I was looking for someone who has used it, and has any general observations on it.

Ill be running this on a 520ST, and two DS 3.5" floppys, and a colour monitor (no hard drive, or RAM expansion. _yet_)

Thanx

Billy D'Augustine
Azog-Thoth@cup.portal.com

PS: a question totally unrelated. Is there any way to fake the ST out when using a colour monitor, into thinking its a monochrome? Id like to get the high res, but dont wanna have two monitors. I am thinking maybe dropping or raising a line marked 'monochome detect' that I see in the pinout.

Thanx again

338. Re: TT HD floppy

Newsgroup: comp.sys.atari.st
Date: 1991-06-11 06:32:40 UTC
From: meulenbr@cst.prl.philips.nl
Message-ID: <meulenbr.676621960@cstw18>
Source record: 231275

seimet@rhrk.uni-kl.de (Uwe Seimet [Chemie]) writes:
]With the TT and MegaSTE-versions delivered in the moment you can use a HD
]floppy drive right from the start, you have just to plug it in.
]If you use HD discs in this drive, TOS first recognizes a read error. It
]automatically switches the speed of the floppy controller to 16 MHz and tries
]again. So some kind of the hardware presented in ST Computer 1/90 (HD drives
]for the ST) is built in.
]Nevertheless I found two problems. My controller doesn't work correctly with
]HD discs if the machine has warmed up. Apparently the controller doesn't like
]16 MHz too much. If you use programs like ROMRAM or ROMSPEED you get problems
]writing on these discs. It seems as if this is a timing problem, because after
]moving the rom to the fast ram the floppy subroutines of TOS are to fast and
]report a timeout.
]To get a button "High Density" in the desktop format dialogue you have to set
]configuration switch #6 to ON. Selecting this button to format a HD disc fails
]on TOS 3.01 but wait for TOS 3.05 ...

Does this mean that there is a HD drive installed.
The latest I heard was that apparently the current 1772 floppy disk
controller is only rated for 8 mhz, and you'll need a 16 Mhz version
for HD drives. It seems that Western Digital does not manufacture such
a version, but that atari bought the rights and is going to manufacture
its own chip.

339. Atari selling Taiwan plant

Newsgroup: comp.sys.atari.st
Date: 1991-06-11 07:32:30 UTC
From: steve@thelake.mn.org
Message-ID: <A336533195@thelake.mn.org>
Source record: 231266

The Wall Street Journal reports that Atari Corp. is selling its assembly plant in Taiwan for $60 million (and collecting an unspecified profit on the transaction) and will shift the work to subcontractors in Taiwan and Hong Kong. The article quotes an unnamed Atari spokesman as saying that the company lost $2 million in the first quarter because of problems in assembling ``a newer product line'' at the Taiwan facility.

340. Mega STe processor speed switch

Newsgroup: comp.sys.atari.st
Date: 1991-06-11 08:01:47 UTC
From: meulenbr@cst.prl.philips.nl
Message-ID: <meulenbr.676627307@cstw18>
Source record: 231290

Hi,

I've been told that the Mega STe can switch the processor speed.
Most likely this is controlled to write some magic value into some
unknown register. Unfortunately the local Atari Subsidiary could
not supply me with that info, since they could not get it
from Atari Sunnyvale. Is there someone on the net who perhaps knows
this information? Or could someone with a Mega STe (I don't have one)
look into this and disassemble the bios call which does the speed
switching, and post the results of this disassembly (or mail me
the disassembled code so I can dig in it myself).

Thanks!

davidli@simvax.labmed.umn.edu writes (sarcastically :-):
>... Come to think of it, why isn't the Atari ST
>an IBM compatible computer? Gosh, it makes me so mad to think of the large
>number of *useful* things that could have been done with the ST if only it'd
>been an IBM compatible.

Seriously I've been saying that more and more these days when I see the kind
of software you get for PC's.

"Is there an ST version" - "Nope"

> It's only a waste if you believe you
>*deserve* more than what you supposedly purchased with eyes wide open.

Well to be honest, back in '86 when I bought my ST I thought I was getting
a 16 bit version of the 8-bits. How wrong I was. That machine is the Am*ga
since the designers of the 8 bit moved on. As a result I got no fancy hardware
and have been doing things the hard way ever since. BTW: Am*ga owners need not
follow this article up because I'm not interested.

>David Paschall-Zimbel davidli@simvax.labmed.umn.edu

Anyway this discussion started with my calling the Bob Dobbs characters a
waste. Sure this sort of thing is commonplace but I think that fun extras like
this should only be put in after every serious usage has been covered.

I resent the effort Atari put in to hidden messages, useless characters and
rainbow fuji logos yet only release new TOS versions once in blue moon and
can't be bothered to release new fixed versions once the bugs show up.

The smiley face in the PC character set is at least non-specific.

Just to play devils advocate for a moment <grin>, do you think they
really sold the plant because of these "assembly problems" or do you
think it was because they needed the cash to buy back some of their
debt?

Cheers,

Chris

I wonder how many people knew, when they bought their STs, what was
contained in characters 28-31 (or whatever the numbers are)? Very few,
I suspect.

On the other hand, Neil Forsyth's plea for IBM-style text box corners
may be felt to be a bit over the top by people who think that the ST
wasn't primarily designed to run IBM-style text-based programs. :-)

> Steve saj@chinet.chi.il.us

Well from what I know, there have been a lot of Problems with RTS/CTS
flow control with all the Atari range, there are a few Fix programs
for this.
The other problem is runing the serial port faster than 19.2 kbs, this
was to do with the clocking options to the MC68901, if the * 16 clock
option is not on, you don't have the receive data transition resynch
logic enabled, the * 1 clock option is stated just for synch use only.
It could be posible to clock the chip faster, but have not looked at
the Timer 'D' settings.

There have been postings from Atari About this, I do have 2 doc files
but don't remember what was in them..

You should be aware of the fact that NVDI currently ONLY seems to work
well in monochrome resolutions and actually slows down GEM operations
in the other TT screen resolutions. It's also somewhat slower than
either Turbo ST or Quick ST 2 when running on an ST, and also slower than
Quick ST 3 when running on the TT in a monochrome screen resolution.
Currently there is only one product available (and I'm sure you can guess
what it is) that not only runs on the TT (sorry Turbo ST!) but actually
significantly speeds up ALL TT screen resolutions (sorry NVDI!). :-)

Well I've had Neodesk 3.0 for quite some time and I find it very useful. It has keyboard commands for all your normal pop down menus. It is very custsomizable and has other features to numerous to mention. I use it every day and find it hard to go back to the normal atari desktop.
A happy customer.

There is a autoboot program whose name escapes me at this time at atari.archive either COLOREMU or MOMOEMU (something like that). That does this quite well. I've only encountered a few mono programs that don't work with this emulator. The catch is the screen resolution is obviously not as good and the response of the mouse movement is also slower.

The Fidonet gateway egsgate.fidonet.org is retransmitting old news with new message-IDs and bogus From: lines. If you want to file a complaint, postmaster@f98.n250.z1.fidonet.org or postmaster@egsgate.fidonet.org should be the right place to send it.

Don't expect a prompt, courteous response. The last time I reported an egsgate problem, I got no answer at all, so I posted a message in news.admin. The egsgate operator ranted at me for weeks, denying that there was a problem and accusing me of ill will.

It might be more efficient to just install a global kill for Fidonet.

Source record: 231292

One netter asked about the MIPS on the TT. It's like the Mac commercial says, it's not how many MIPs but how useful the machine is. I have an ST at home and a TT at work. I also support PC users at work (they have COMPAQs). Both my ST and the TT make the COMPAQs and WINDOWS 3 look like real kludges. The COMPAQ users are always asking "Why is everything so SLOW!".

You HAVE to experience WINDOWS 3 on a PC just to see how cumbersome and slow this is.

As for price comparisons; a TT with 4 megs and VGA monitor is under $3000 Canadian dollars. A COMPAQ 386/33 with VGA is just under $5000. The TT looks like a good buy to me! Oh yeah, both have 50 meg drives.

Another netter asked why the MegaSTE and TT take so long to boot; this is discussed in the manual. The quick fix is to hit the spacebar about 10 seconds after powering up. The other fix is to have a boot floppy with NOROACH (PD from Atari). I use the latter and have a 15 second delay set for the NOROACH pgm. Works great!

Alyre Chiasson from UNB asked about Ataris and lasers. I have an HPLJII on my TT at work and an Atari SLM605 on my MegaST at home. The absolutely FASTEST thing going on the planet is CALAMUS on an ST or TT and printing to an Atari laser. Forget what people tell you if they do not work with both the HPLJII and the Atari laser on a day-to-day basis. For sheer speed, NOTHING can outperform the Atari laser. I am ordering a utility from a company in Germany. It will let me print to the SLM605 under Spectre emulation. This combo outguns the Mac to an Apple Laserwriter. All you have to do is try printing to an HPLJ under Spectre and you'll wish you had gone for the Atari laser. The HPLJ via the parallel or serial port printing MAC stuff is useless unless you add a postscript cartridge. By the time you do that, it's a lot more expensive than the Atari laser (which sells for $1299 in some places in Canada).

Greetings;

I posted this a few months ago and had several replies, but
my Dad decided not to sell the Mega until he had his database
up and running on his new 386. Said database is now alive and
well in Paradox, so I am posting again.

Mega2, 20mb hard drive, colour and mono monitors, TONS of software,
etc etc etc. Best offer over $750.

Atari 1040ST with mono monitor (monitor does not work) :-)
mouse, 1 floppy, and tons of software...$300 or bo.

Take 'em both for only $999. That way, ya get two working monitors.
I don't have time to troubleshoot the mono monitor for the 1040.

From: marc@uni-paderborn.de
Message-ID: <1991Jun11.190859.16688@uni-paderborn.de>
Source record: 231272

In order to get all the nice stuff running, that is available
nowadays for the ST (I own a good ol' 1986 520 ST+),
how much memory would you recommend me to add to my 1 MB?

The "nice stuff" mentioned above would include Gnu stuff
(Emacs, gcc, g++, gdb [Is there gdb for the ST?]), and MiNT,
mgr, bash. Anything important I missed?

I really like my ST for what it is, namely a good typewriter.
But I would like to be able to do some decent C hackery at home
and have my favourite tool (Emacs) around. I know the ST is slow,
but I can live with that. I don't have the money to replace my
ST with a state-of-the-art ?86 AT with some Unix.

Or does anyone think it's not worth it? Should I better throw
my ST out of the window (e.g. keep on just using it as a
typewriter-calendar-addressbook-videogame-terminal-thingy)?

Any comments welcome,
Marc

These are Magic Shadow Archive files. You need to get the dearchiver. I beleive it's at atari.archive.umich.edu in atari/archivers as SHADOW.LZH or SHADOW.ARC.

>where I can get hold of fonts/icons for MGR... and what do I do with them -
>I.E. where can I get docs too?

It seems that you downloaded `mgr.???' but not `atarimgr.???'. The latter
is tghe original and contains fonts and docs (as well as mgr), while the former
has the updated mgr.

Grab atarimgr.???

Warwick.

You will have almost the same amount of free memory with a hard drive as without. The driver only takes up a few bytes. If you could run Word Perfect and Timeworks DTP before (which I suspect you could) you can still run them with a hard drive, only MUCH, MUCH faster.

I don't think that Atari has guaranteed that only MegaSTEs will have TOS 2.xx.
A safer way to determine this would be to check the cookie jar. You can just
do it once and store the value somewhere.

367. WANTED: Atari ST

Newsgroup: comp.sys.atari.st
Date: 1991-06-12 02:18:04 UTC
From: das9674@usl.edu
Message-ID: <32748@rouge.usl.edu>
Source record: 231212

Hi! I wonder if any of you out there would like to sell me your old Atari ST.
I was looking for a 1040, most likely, with a monitor in the deal.
Also, please include possible software.

I have seen people in misc.forsale.computers selling their STs for around $200 for the computer and the same for the monitor. It doesn't look like my summer job will get me enough money to buy a Clone, and I really like Dungeon Master.

So e-mail if you're interested. My friend WOULD sell his for $300 for all to get an Amiga 500 instead, but the 'up arrow' doesn't work AND he still ins't sure he wants to sell it!

Thanks a lot!

368. Post Finals Game Help Wanted

Newsgroup: comp.sys.atari.st
Date: 1991-06-12 04:34:44 UTC
From: elvis@watnxt2.ucr.edu
Message-ID: <15195@ucrmath.ucr.edu>
Source record: 231281

Well, my finals are over, so I thought I'd relax by playing some games... however, my computer has conspired against me in my quest for fun. The two main games that I have been trying to play are Phantasy III and Bard's Tale. Both give me trouble when it comes to the saved game disk. In Phantasy, it saves the game fine for a little while, then will start to lose it...the picture of the town will be divided into vertical strips, and lose most of its colors. Shortly after this, the demon will appear, but I will have no party, and the list of characters will be empty... The Bard's Tale problem occurs before I can even get going, in that it never recognizes the character disk, or, rather, never seems to write it... I have been following the instructions, but to no avail. All this leads to my plea for help...does anyone know if a) either of these games require a specific tos version (I have 1.2, which has always seemed somewhat safe...) b) there is a good way to check the reliability of my drive or c) if someone has a copy of what should be on the character disk (dunno if that would be copyrighted or not) so I could see if the dang thing recognizes it...
Thanks,
Andrew

>its own chip.

There is no HD drive installed (yet).
You are right that the 1772 is designed for a rate of 8 mhz but this is not
the first time 16 mhz are used (remember ST-Computer 1/90, 2/90). Of course
a 16 mhz version were the best but at the moment the 8 mhz version works at
at rate of 16 mhz when you use hd drives.

Don't forget that NVDI includes a GDOS. Turbo ST and Quick ST don't.
Turbo ST had problems with several programs (e.g. SIGNUM). BTW, if you
use a TTM195 you don't need to speed up colour resolutions.

Actually, even with MGR you'll need to like command lines (us UNIX types do :-)
at least until someone writes something like a MGR desktop. MiNT works well
from a shell that supports it (bash, ksh, and the init that comes with it).

You can do useful stuff in 1 meg, but, yes, more memory is _very_ useful.

Once you get it running, it _is_ great! (Perhaps someone would care to replace
the piccy of Bob in the character set with one of Eric Smith? :-)

> nowadays for the ST (I own a good ol' 1986 520 ST+),
> how much memory would you recommend me to add to my 1 MB?

Recently, I did some horrible mangulations to my ST to put two 1MB SIPs in it. Subsequently (now with 2.5MB) I have had no problems whatsoever with memory. I use Gcc occasionally (but usually only on small code) - gemini, Calamus, Uniterm, MicroEmacs etc - and (apart from trying to load dozens of fonts into Calamus) have _never_ wished I had more memory. I'd say that 2.5 is a reasonable point to go to. Not very expensive, either.

> ... Anything important I missed?

Apart from gemini? 8)

> I really like my ST for what it is, namely a good typewriter.

> ST with a state-of-the-art ?86 AT with some Unix.

I have an old 10MHz '286 running an elderly (2.1.1) Xenix that I use as a 'unix' machine... it does the job quite nicely... (faster than a Vax! 8) (okay, okay, better response time :)

> Or does anyone think it's not worth it? Should I better throw
> my ST out of the window (e.g. keep on just using it as a
> typewriter-calendar-addressbook-videogame-terminal-thingy)?

Depends. If you have a hard disk, it's worth it. If not, best buy a new system. (not being defeatist here... and I am basing this on _my_ experience here in Oz with astronomical prices and all.

377. GCC, the documentation...

Newsgroup: comp.sys.atari.st
Date: 1991-06-12 12:42:04 UTC
From: ermadmin@uniwa.uwa.oz
Message-ID: <1991Jun12.124204.19116@uniwa.uwa.oz>
Source record: 231205

I am just playing with GCC on the ST and find it great!
However, I dont know where to find the documentation for the stuff.
Is there a complete set of words for it - and if so where?

I would really like to find docs for all the functions.. printf()
and all the stuff.

The few docs that I have seen are in TEX format - that is not a lot
of help for the people out here whe love GCC but hate TEX!

..Here's hoping
..Clive

ps - please post any replies to the net as my account is off
at the moment and cannot, i think receive mail...

379. Info wanted about upgrading an SF354 to DSDD...

Newsgroup: comp.sys.atari.st
Date: 1991-06-12 13:02:11 UTC
From: mspacek@fquest.fidonet.org
Message-ID: <ceJF41w164w@fquest.fidonet.org>
Source record: 231217

Just wondering if anyone out there has taken a DSDD drive and stuck it in an SF354 and how it worked out. It doesn't look like it would be much harder than doing the same with the ST internal drive and I know some guys who have done that. But it probably will be a bit harder than that, if not much. To switch to a DSDD internal, I think you pretty much just throw away the little interface board for the SSDD drive and stick the DSDD in there. There is a little board in the SF354 also, but I kinda need to keep it for the DIN jacks. It doesn't seem to do much, just a couple jacks, small board with a little buffer chip on it and some wires coming out the other end to and edge connector. Anyway, I just thought I would ask and find out if there might be more to it than I think before I start messing with it. Surely someone has done this before, right? Any help would be appreciated. Sending it as E-Mail rather than posting it here would be best, otherwise its possible that I might not see it before it gets purged because of hard drive troubles on this system. Thanks.... Mark....

380. Opinions on some books needed

Newsgroup: comp.sys.atari.st
Date: 1991-06-12 13:03:23 UTC
From: scoile@gmuvax2.gmu.edu
Message-ID: <1991Jun12.130323.24585@gmuvax2.gmu.edu>
Source record: 231286

My local Atari dealer is having a sale this week, and is advertising the following books:

Atari ST Technical Reference Guides, volumes 1, 2, and 3
The Atari ST Machine Language Book

Seeing as books on Atari internals are hard to come by (short of paying the rediculous fee Atari charges for the developers package), I'm interested in what these two books have to offer. Has anyone read either of them? If so, what can you say about them? Are they worth buying?

Please reply quickly, as the sale ends Saturday, and who knows if they'll have 'em after that. For that matter, who knows how long they'll even be around... *SIGH* Thanks in advance for any advice!

>monitor (no hard drive, or RAM expansion. _yet_)

This is the best $50 you can spend if you have a hard disk. Without one, it's utility is somewhat weakened (easy fix, get a hard drive!!). The latest version is 3.02. If it turns out that you have 3.01 (which was the release version), the patch program to upgrade it is available from atari.archive.

>PS: a question totally unrelated. Is there any way to fake the ST out
>when using a colour monitor, into thinking its a monochrome? Id like

There are several mono-emulators that are PD. They do work most of the time, but the screen quality is bleeech. Get yourself a mono monitor. It is one of the best reasons to own an Atari ST!! I could not live without mine (I am thinking of buying an extra . .). You can obtain a used one through the net for about $80 (on a good day :-).

You need a copy of Magic Shadow Archiver (MSA), which compresses an entire disk into a (big) file, including formatting info. It is on atari.archive, probably under the name shadow.arc (in the archiver directory).

383. Z-RAM made my drive go nuts! WHY!!?? CORRECTION.

Newsgroup: comp.sys.atari.st
Date: 1991-06-12 13:38:02 UTC
From: d90-ngp@sm.luth.se
Message-ID: <1676@tau.sm.luth.se>
Source record: 231210
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have upgraded my 1040 STFM to 4 megabytes with Z-RAM. My ST was one of those with soldered MMU-chip, so I let a proffessional do it for me. When I got my ST back I ran the test program. Geee, four megabytes and no complaints! I started to install Neodesk 3, reads files from one disk and started writing on another. Then suddenly the drive starts making noise. It sounds as if the drives' motor tries to move the head right through the side of the machine. Two dialog boxes explains that the drive does not answer and that the disk is full, although it has 800 kilobytes free!!! A couple of minutes later I conclude that MY DRIVE READS AND FORMATS DISKS IN ALL POSSIBLE COMBINATIONS OF SECTORS AND TRACKS, TWISTED AND NOT TWISTED, FROM GEM, FROM NEODESK 2.05 AND FROM ALL PROGAMS THAT I HAVE BUT IT CANNOT WRITE MORE THAN A COUPLE OF KILOBYTES ON ANY DISK!!!

Now I am in desperate need of HELP!!! The proffessional will do his best to fix it, but it would probably go much faster if anyone have had this problem before and can give me any clue where to start dig. You cannot be to detailed.

DETAILED DESCRIPTION OF A FEW MINUTES EXPERIMENTING
==========
Equipment: 1040 STFM, monochrome monitor, Z-RAM and nothing more!

Inside Neodesk 2.05:
Trying to write to an empty disk formated before memory upgrade.
Drive writes some 10 K, makes noise, dialog boxes sais: Drive not responding.
Disk full.
I cancel writing, "Show info..." sais more than 800 K free.

Same test and same result again a couple of times.
Formats disk in different ways, same test, same result.
Try to load First Word +, Neodesk responds:

An address error has occured (3 bombs).

System register:

d0: 00000800 a0: 000030C2
d1: FFFF0F0F a1: 00008092
d2: 00000027 a2: 00000000
d3: 00000000 a3: 0005DF08
d4: 00000000 a4: 0000313A
d5: 00000000 a5: EB7E4A11
d6: 00000006 a6: 000015E2
d7: 00000006 a7: 00001592

ssp: 00001592
usp: 00060A40

instr: 3D6D
sr: 2300={t:0 s:1 interrupt: 011 x:0 n:0 z:0 v:0 c:0}
pc: 00FC60EA

I pressed return, a fourth bomb showed up, all went black and the computer rebooted.
I started Neodesk 2.05 again and then loaded 1st Word +, no problems!
Loaded a rather large document, changed to empty disk and tried to save.
Disk wrote some 10 seconds, then made that uggly noise again followed by dialog boxes telling drive don't answer and (the empty) disk full.
I cancelled. Drive made noise, same boxes. Cancelled again etc.

I reset the computer, made the 1st Word + test again from GEM, computer loads program and behaves as before.

Loaded Calamus (from Neodesk), played around a little. Rubberband boxes sometimes leave sides of the box unerased when changing size, in a way I never have seen before. "Show statistics" tell me that I have 3.3 meg free.
Suddenly... 2 bombs! Crash is so hard that even Neodesk got stuck (never happened before).

I GIVE UP.

UPDATE: A few hours later I made another test: I tried copying files to a ram-disk (in GEM) and my ST bombed again. I restarted with the on/off button and tried again a couple of times. Each time two files were copied and then either one or two bombs showed up.

CORRECTION: Sorry, in the last sentence I mean ...either two or three bombs showed up.

It is probably boulder.colorado.edu, but I don't do uucp when I can
avoid it, so I'm not sure that they are really the same host.

Most people don't need to worry about all this because most sites have
"smart" uucp routers, and root@gbs.UUCP should do the right thing.

If you tie the mono-detect line to ground the ST thinks it has a mono monitor hooked up to it. The scan rate goes to 70Hz and all you see on the color monitor (actually I'm not sure about the color monitor, but on my TV) all I see is scrolling orange lines. In other words, it don't work that way. But, you may be able to hear the audio. :-)

Here, here! Don't forget that E. S. did the latest port of Nethack too!
But I think instead we should replace the Rainbow Fuji in the TOS 1.4
"About..." box with a "Rainbow Eric". The Bob Dobbs characters have been
recently reserved by Atari UK for later use as box corners. :-)

The manual for the modem (I have the same one) recommends using XON/XOFF flow control in the modem and RTS/CTS at the computer. However, if the poster above is correct regarding problems with RTS/CTS with Ataris, you can turn off flow control in the modem and rely on XON/XOFF at the computer.

d90-ngp@sm.luth.se (Niklas Grip) writes:
>Is it usual that multisync monitors don't have loudspeakers and
>whatabout the TT?

Yes, it's true that most monitors don't have speakers. The TT has a speaker built in. It also has stereo output jacks on the back so you can hook it up to an amplifier and speakers, and you can turn off the internal speaker if you want. The idea is that the internal speaker can be used for normal stuff like beeps and bells, but for high-quality digitized sound you're likely to want to use the stereo outputs. The digital sound always goes to the stereo output jacks; you can control whether the PSG sound (clicks and beeps) also goes there.

Sure, Atari gives you 4 characters of pure slack and you want BOX
CORNERS. This just proves you are SQUARE and haven't smoked your
daily dosage of frop. Send all your money to "Bob", and you might be
forgiven IF YOU ARE LUCKY.

The thing I like best about my ST is that "Bob" is in the character
set. They should have used 16 characters and given him the space he
deserves.

I have a stock 1040STF (TOS 1.0 in ROM, 1 Mb memory, 8 Mhz 68000,
internal DSDD 3 1/2" drive, serial, parallel, DMA, Midi, mouse) that I'd
like to get $200+S&H for.

I also have a SC1224 color monitor (original JVC, crisp&bright,
better picture than modern SC1224s). It handles 50Hz just fine (usually
used when running demos or European games). I'd like $200+S&H for it.

I'll sell the pair for $365+S&H.

atari.archive's gnustuff directory in under reconstruction at the moment.
You will find docs in ~ftp/atari/gnustuff/Doc. I will run a detex program
on them to produce a plain ascii version.

Cheers,
Graham

396. Rings of Medusa questions...

Newsgroup: comp.sys.atari.st
Date: 1991-06-12 23:30:54 UTC
From: mmkowanetz@spurge.waterloo.edu
Message-ID: <1991Jun12.233054.18376@watdragon.waterloo.edu>
Source record: 231296

Anyone who hasn't played the game Rings of Medusa, you can ignore this article.

When you enter a city, and enter a temple within the city, sometimes they give you a clue to where a treasure is located.
ie. 13 degrees 21 minutes south, 26 degrees 15 minutes west

Now, when I go there and send out my scouts, they always return saying, "Sorry sir, we found nothing." Am I missing something here? I've outfitted them with extras and machines, but is there perhaps something else I need?

In addition, when attacking with the warship, I can't seem to hit any enemy boats with my cannon. There's no indication of where the cannonball is going, so I don't even know if it's firing or not!

Any help that can be given would be greatly appreciated.

Please reply by mail as I don't read this group regularly.

Final Announcement

The Department of Architecture at the University of California
is putting together a catalog of software used by architects.
The book will include all software used in the profession,
including CAD, project management, modeling, rendering,
facility management, etc.

To be included in this reference guide, firms and individuals
must fill out a two page questionaire available by mailing a
request to:

Douglas Noble, AIA, Ph.D.
Department of Architecture

Try Windows 3.0 using a 486-33 with 130Meg and 1024x768 SVGA 256 colors, 1.44 Meg floppy and ISA bus, motherboard expandable to 64Megs using 4Meg SIMMS, all for under $2700.00 US dollars. And COMPAQ machines are slow compare to some compatibles rolling out these days. And also if you can't get those people to get a new system, try buying new SVGA cards using VRAM, or TIGA cards which is said to be upto 10x faster than any VGA card out that should solve most of the slowness experience on Windows 3.0, I'm using Windows 3.0 and its faster than window type environment I've seen or used.

>
> Steve saj@chinet.chi.il.us

I have done some preliminary probe into this matter two years ago and there was absolutely no problem at all. Expanding up to 8 MB is rather easy if you know how to build a RAM board for 68000 CPU. The reason I haven't done it yet is that so far I couldn't persuade the DMA controller to handle the upper 4 megabytes. I have recently heard that CRT controller (SHIFTER) can be persuaded by poking their I/O addresses (Reflex board does this and allows us to use any kind of monitor on TOS 1.4). I don't think using a RAM disk of 4 MB is very fantastic (I'd rather use a hard disk). Another thing I had to consider was using Standard SIMMS sockets...

Germans actually sell expansion boards, but they are VERY expensive at least in England where I am based in a way. A 4 MB expansion module costs Sterlng Pounds 689.43 at Atari Workshop in Windsor. It may not include the actual chips which they charge StgL 275 for 4 MB.

On the top side of the IC there is a bevel on it with a dimple,
This dimple is over pin 1, and the pin to the left side of the Dimple is 68,
and the left most pin on that side is 61,
Note pin 61 is connected to 0 volts.
* <- Dimple
61,62,63,64,65,66,67,68,1,2,3,4,5,6,7,8,9

402. Lattice C

Newsgroup: comp.sys.atari.st
Date: 1991-06-13 02:46:14 UTC
From: david10@garfield.cs.mun.ca
Message-ID: <1991Jun13.024614.7493@garfield.cs.mun.ca>
Source record: 231201

I just purchased a copy of Lattice C (v. 3.03.02 (c) 1986 . . . hey, for $20 CAN used, I can't complain :-)), and I have a few questions (my apologies if all of these questions were answered recently on the net) :

1) What are the major differences (improvements) to the compiler in its latest version (v. 5.01?)?

2) Is Metacomo still in business? If not, who is carrying the line?

3) Is an upgrade path available, and is it worth it? (at the moment, I'm just writing small, uncomplicated programs for use on a UNIX platform. Since I can't always get through to the system via modem, why not use the ST?)

E-mail would be preferred, unless you feel it would be more appropriate to post.

Thanks in advance,
Dave C

403. Mac hard drive w/ GCR

Newsgroup: comp.sys.atari.st
Date: 1991-06-13 03:23:12 UTC
From: stmwang@hubcap.clemson.edu
Message-ID: <1991Jun13.032312.6568@hubcap.clemson.edu>
Source record: 231236

For GCR users: remember how Dave Small mentioned how he moved his hard drive between his Mac II and his GCR? I have always wanted to do that, to use the same drive on a Mac II at work and on the Spectre at home, but never found out exactly what to do. Well, I've just found out! It is simplicity itself! IF you have an ICD FAST drive, all you would need is a 50 pin SCSI connecter and a REAL Mac drive, such as the Quantum 105 meg selling for under $400 now. Plug the Mac drive in the FAST drive and go! It has both a Atari daisey chain connector as well as a standard 50 pin SCSI connector on the back. Just remember to choose the extra DEVICE when you boot up Spectre.

BTW, the Mac drive mentioned above should be an external hard drive, with its own power and case. If you ever wnat to use it on the Spectre ONLY, just take it out of its case and plug it into the extra slot in the FAST case.

Now I have room for System 7, the minute Dave gets it working!

Unix Windows is very good. Just one important facet you forgot to mention:
its needs BSD flavoured unix to run. Those like myself with SysV will have
to wait till someone rewrites the whole package for it.

There is at least one X server package for the St. Its made by a German
company, and sold with their ethernet adaptor. I can't find my documentation
on it at the moment, but as soon as I do I'll post details about it
(unless someone else does it for me).

I just receive the cable to fix the monochrome problem which was vertically shifting before. WOW no more problems, NICE!!! But unfortunately the cable is shorter than the orginal. It took nearly 3 months for a replacement but worth while waiting for. SOOOO to all who reply 3 months ago to my help THANK YOU!!! My ICD 68meg and the mono is working beautifully together hopely forever.

Thank You Again,
Jeff

406. CD-ROM players

Newsgroup: comp.sys.atari.st
Date: 1991-06-13 04:11:06 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1991Jun13.041106.22053@rodan.acs.syr.edu>
Source record: 231241

I know I asked this a while back. I only got one response,
and I've misplaced it...so I thought I'd ask again, in a
slightly different way.
Is anybody using a CD-ROM player made for another computer,
e.g. Mac or msdos, on their ST via an emulator such as Spectre
or ATSpeed or Supercharger? These players seem to be scsi
devices for the most part, so I was wondering if it would be
possible to hook one up via my scsi chain and run in via an
emulator?
Thanks very much for any responses along this line.

>(clicks and beeps) also goes there.

One thing about the internal speaker is more or less annoying. If you run
programs that boot from disc there's no possibility to switch off the sound
unless the program allows it.
So if a program (especially games) makes a hell of a noise you can do nothing
against it. (There's only one solution: Don't play games.)

>
> Randy Hosler

The reason the ST polls the /MONO line 50/60/71 times a second is to avoid blowing the sh!t out of your color monitor.

The horizontal osc cctry will try to lock to twice the normal horizontal scan freq... this oscillator is also used to generate the EHT in your system. If you're lucky, all that will happen is that the osc will freerun and make a bit of a squeal. However, if you aren't lucky... anything from the horiz. o/p transistor, the EHT coil, tripler, or even the tube (unlikely) may fail. These failures, involving _very_ (20+KV) high voltages can be messy, noisy, smelly, and _very_ expensive.

Don't do it.

Matthew

411. Source for BASH 1.05 (MiNT)

Newsgroup: comp.sys.atari.st
Date: 1991-06-13 10:57:56 UTC
From: dpg@cs.nott.ac.uk
Message-ID: <1991Jun13.105756.17667@cs.nott.ac.uk>
Source record: 231246

I've had several requests to put the source for the version of BASH I used onto a.a, so I've just sent it off.

This is the UNIX version, and thus needs to be patched with my diffs (included) before compilation. Also included is the GNU readline library, which is needed for line editing and history.

Have fun!

From: cordes@ac.dal.ca
Message-ID: <1991Jun13.083322.497@ac.dal.ca>
Source record: 231245

New upload to Atari Archive: PLOT150.LZH

This is an upgrade to PLOT125.LZH, which has been in the applications directory on the terminator archive. The program is a 2D Function/Data plotter for high/medium resolution ST's. Some of its features are:
* Plots functions typed at the keyboard. Large range of function primitives to choose from.
* Data (x-y coordinate pairs) can be entered in a simple editor or read from a file. Some data transformation and fitting capability is included.
* Multiple curves can be overlaid on the same plot. Text can also be added.
* Good quality output is possible via GDOS (GDOS drivers/fonts are not included).
* Various numerical utilities (new in this version) are built in, including numerical integration, finding zeros of functions and complex roots of polynomials.

In order to extract into a particular directory you have to
specify that path as the argument to arc, and append the pattern
for the files to be extracted
e.g. : arc x any.arc c:\tmp*.*

Don't no whether the same method works for unarc.

By the way, West Germany mentioned in your disclaimer does no longer exist.

Reiner.

Hi,
I don't know what the STE hardware is like, but it IS possible to connect more
than 4MB to an orinary ST. There is a company (I think 'Richter Daten-
technik' or something like that) somewhere in Germany/Switzerland (??) who
sells an expansion which can handle 12 or 14 MB - but it's quite expensive.
A friend of mine has just developed such a thing. It works fine at up to
14 MB - but it's only a prototype now. It is a bit more complicated then
connecting 1-4MB to the existing MMU - you have to build part of a new MMU
to handle the memory above 4MB and do some other nasty things in order to
get the video system use the additional memory - but it can be done.
I think it should be possible on a STE, too.

Gadgets by Small has a 68030/8Mb expansion board which will combine your
on-board memory with the above to give a Mega 4 a whole 12Mb of RAM!!!!!
I saw Mr.Small at CeBIT this year and he showed me this marvelous expansion
board for Megas. There are a lot more details about this board and I
recommend contacting him for more information.

419. Emacs, where to get?

Newsgroup: comp.sys.atari.st
Date: 1991-06-13 14:19:30 UTC
From: hess@rospc1.informatik.uni-hamburg.de
Message-ID: <hess.676822770@rospc1>
Source record: 231226

Hello,

as I`m preparing my ST to get full use of all the Gnu stuf (g++, gcc etc.)
I would like to use Emacs also (at least test it). So I looked through the
ftp sites and only found horrible archives of sizes at about 1,3MB. That`s
not fun, so my question: are there any other, complete Emacs archives (without
source of emacs), may be in germany or at least europe? Where?

420. ATSpeed

Newsgroup: comp.sys.atari.st
Date: 1991-06-13 14:30:34 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1991Jun13.143034.15589@rodan.acs.syr.edu>
Source record: 231156

I've been using ATSpeed for almost a year now, and I like it very much! I'm running Window3.0 and various other programs, and in general everything seems to be working out. I do have problems, though, e.g. I have yet to find a hard disk cache that works (I've tried Smartdrive[comes with Windows], Hyperdrive[a shareware program], and PC-cache[which comes with PC-Tools Deluxe (v.6)])...Also, I still haven't figured out how to reload the system font with speedfnt after I've switched to another font. All in all, however, I'm happy I got it when I did...it has done a lot for me.

The reason I'm posting this here is that I don't really have much support. I bought the unit from Talon Technologies, and while they seemed very professional, polite, etc on the phone, they were not able to answer all my questions nor do they seem to respond to written questions. In a nutshell, I don't feel I have the type of support for my msdos emulator that I dofor Spectre...This is partly due to the fact that the maker of ATSpeed is in Europe, which does not lend itself very well to phone calls or snail mail (and of course, Gadgets is great with their support), and partly due to the fact that there are a lot fewer people using ATSpeed here in the US than there are people using Spectre. So, I was hoping to find people who use ATSpeed, so we could share experiences and maybe help each other out in this way. If you are an ATSpeed user and would be interested in getting a list of other users who have access to the net, let me know and I'll try to put together such a list and distribute it to those who want it...I know I'd be interested, so that maybe I'd find out about a cache that works, and I'd be happy to let others know about things I've been able to do (or not).

Thanks very much.

>
>likos@clinet.fi

Hello Johannis,

i attended the CeBIT 91 as manufacturer of OverScan and we were at the same booth as Biodata. Since i work a lot with X-windows in the university, i and the one from biodata installed the x-driver. First we installed it on a normal MEGA ST. The x-driver was an DA that run in the background. If you select the DA, you see a second screen with the X-interface. Since the ST could not initially start/run any clients, you had to start an xterm client via a normal terminal-program on the ST-screen. After a switch to the X-screen the xterm appeared and one could start other clients like the motif window maniger on the host maschine. To get back to the ST-screen one had to type a shift/alt/control key combination. The X-Load and other things continued to work on the X-screen, update was done in the AES-multitasking, i think.
The performance of the MEGA was not very good, little slower than a sun 3/50. On the next days we installed X-windows on the Atari TT and the performance was better. The programmer was also at the CeBIT 91 and he said that this was a non optimised version and the real version will be a lot faster.
The TT-Bigscreen is already supported, but our overscan-modification was not yet supported. I talked to the programmer and so i think the overscan modification will be supported in future...

Greetings, Karsten

422. MIDI Input to MIDI Standard File

Newsgroup: comp.sys.atari.st
Date: 1991-06-13 15:17:16 UTC
From: reiner@estevax.UUCP
Message-ID: <2288@estevax.UUCP>
Source record: 231234

I need a utility which read and buffers MIDI input and allows
saving in MIDI standard file format.
Does anyone know of such a program ?
Where can I get such a program ?
Or, if i have to write such a program by myself finally, where can
I find the MIDI standard file definition (book or mailserver).

Any help is appreciated,
Reiner.

423. New ST bbs in Raleigh!

427. The Mother of All Computer Sales

Newsgroup: comp.sys.atari.st
Date: 1991-06-13 21:15:27 UTC
From: hindi@eniac.seas.upenn.edu
Message-ID: <44607@netnews.upenn.edu>
Source record: 231151
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

I have the following for sale:

```
For Sale: | asking | I paid
-----------------------------------|-----------------|-------------
1040 STfm + SC1224 Color monitor | |
1 1/2 years old PERFECT Cond | $500 | $1050
includes mouse, 1 meg ram, | |
internal DS 3.5" diskdrive | |
-----------------------------------|-----------------|--------------
520 ST + SF354 external diskdrive | |
includes 512K ram--diskdrive | -> $50 <- | too much
works fine, computer runs well | |
most of time, a little flaky. | |
-----------------------------------|-----------------|--------------
Supra 2400 baud modem | |
external, works like a charm | $60 | $175
add $5 for RS-232 cable | |
-----------------------------------|-----------------|--------------
Star Micronics NX-1000 printer | |
dot-matrix, VERY reliable, | $75 | $299
fast, handsome output. | |
add $5 for parallel cable | |
-----------------------------------|-----------------|--------------
```

All of the above have been treated with the utmost of care, never opened the units, never tinkered with. All equipment includes all necessary power packs and cables except where noted.

I would like to sell the 1040 and color monitor together, but would consider offers for individual parts.

If you think any of the prices are unfair, let me know--maybe we can strike a bargain.

---> Please respond to hindi@eniac.seas.upenn.edu <---

Thanks for your time. (nice chart above, eh?)

I am not from Europe, but I just spent 3 weeks there and I can tell you an American's perspective of the European ST market:

If any of you thought the west coast was Atari-country (flashback...Atari's first ad campaign under the Trammiels) then you have obviously not been to Germany. I looked at one of the 3 Atari magazines at the newsstand in the train station of the former East Berlin and they advertised the Mega STE, the Notepad (handwriting ST), CD ROM players, and many other Atari products that we will probably never see in the States. Walking down the street in West Berlin showed that Atari was in most computer stores, and I passed at least one store with a huge neon Atari symbol in the window.

In Denmark, I talked to a CS student there who told me that the ST was a very popular choice there in Denmark. I also saw Atari's in computer stores there.

Then, to top it all, I was watching a soccer game televised from Germany, and there by one goal where the cameras got good shots of it was a huge "Atari Computers" sign familiar to all of us. (Logo and all!)

In short, Atari is doing very well in Europe, as far as I could tell.
(The only Mac store I saw in my 3 week stay was in Copenhagen!)

Source record: 231181

Tell the guy to check the voltages comming off the power supply..
I bet you will find it isnt 5volts anymore...
When 4 meg of memory is added to a 1040 you HAVE to remove atleast one bank of the mother board memory..
Or atleast cut off the power going to it..
Best electronics seems to sell a better powersupply too for the 1040's..
Although I am pretty sure if you have them disable the ram on the mother board your problems will go away...
(remember the 1040's were made to run ONLY 1 meg of memory and support the ports. Not much over head above that... 520's are a little better since they are really 1040's with half as much memory and half as much drain from the memory..)
The 1meg drams are only half as power hungry as the 256k drams though...
So if you take all one meg worth of chips out somehow then you will actually have as much power used as a 520...
(stf in all cases of course.)

>I would really like to find docs for all the functions.. printf()
>and all the stuff.

There aren't yet any docs for the ST library, however, most of the functions are from either ANSI C or UNIX, and so a good book on one or both should tell you what you need to know. Incidentally, if you not already using it, it's a good idea to go for Eric Smith's MiNT library (even if you don't have MiNT) as it means that your programs will almost certainly behave when used by those of us who do use MiNT.

>The few docs that I have seen are in TEX format - that is not a lot
>of help for the people out here whe love GCC but hate TEX!

Unfortunately (for you, anyhow), the GNU project's standard text formatter is TeX, so you're kind of stumped there! (Perhaps someone could post the info files built from the docs so that we don't all have to make them?)

441. Re: Booting in 50Hz mode

Newsgroup: comp.sys.atari.st
Date: 1991-06-14 13:14:13 UTC
From: steveg@cseic.saic.com
Message-ID: <2865725@MVB.SAIC.COM>
Source record: 231172

(I wrote about problems with my screen rolling in 50Hz mode)...

boyd@fsucs.cs.fsu.edu wrote:

>You need to adjust your color monitor. I had to when I first bought my
>machine, and have not had to since (so you should not have to do it every
>time you switch Hz). However, others have stated that they did not have
>as much success. It does not hurt to try though. There are a couple of
>marked plastic pot screws embeded in the back of the monitor. Find the
>v-hold one and turn (ONLY use a plastic TV screwdriver, and be careful).

THANKS that did the trick!

Now can anyone tell me just who these guys are that wrote things like
the WHATTHEHECK and Life's a bitch demos? The demos are pretty neat
but I'm concerned about references to 'ripping' sounds from commercial
games and 'copy parties' in their 'scroll texts'. Are these demos nothing
more than cut and paste jobs of stolen code and artwork?

Don't do it, as you can't do Zmodem transfers with Xon/Xoff, you must
do RTS/CTS flow control.
Note: There are Fix programs for the RTS/CTS Problem..

Minix-ST with a 4Mb system is quite adequate for the kind of thing
you're mentioning. Most GNU stuff [gcc, emacs, bash...] runs nicely
in this environment.

444. SIMMFIX & 2.5 Megs Ram (STE)

Newsgroup: comp.sys.atari.st
Date: 1991-06-14 16:27:56 UTC
From: carlos@garfield.cs.mun.ca
Message-ID: <1991Jun14.162756.24352@garfield.cs.mun.ca>
Source record: 231176

I recently bought two 1meg SIMMS for my STE. I stuck them in, according to the instructions in the program SIMMFIX (on atari.archive). SIMMFIX is supposed to let you mix 256k and 1meg SIMMS to come up with 2.5megs of RAM. The problem is that the SIMMFIX program doesn't seem to work. When I tried to run it from an auto folder (like the docs say to do), nothing happens, and the computer thinks it has 4megs, instead of 2.5. When I ran it from the desktop, I got the infamous TOS ERROR #35 .

Anybody have a working copy of SIMMFIX?

445. DMJ_GIF 2.0 request!

Newsgroup: comp.sys.atari.st
Date: 1991-06-14 17:08:09 UTC
From: iws9060@eva.fmi.uni-passau.de
Message-ID: <1991Jun14.170809.3197@forwiss.uni-passau.de>
Source record: 231171

As I have heard by someone in the net, DMJ_GIF 2.0 is available via GEnie.
But I do not have a GEnie account. Could anyone out there mail it (or post
it, if more people show their interest), please?

Thanx in advance,
Thorsten Guenther
aka Weregoose

>
> Has anyone encountered this problem and perhaps already solved it?
>

yes, you need a few updates. this problem, along with a newer gdb etc,
were distributed as update8. the bogon alterts for gcc -g will go away
if you use the patches to ld and sym-ld in update8.zoo. You also need
to apply the diffs to gcc in that update to fully utilize -g. Since
then there have been two update, update9 and update10. update10
contains the diffs to bring up gcc-1.40 on the ST. i recommend using
that. all these updates are available from atari.archive.umich.edu
either via ftp or via their mail request server.

cheers,

447. GCC 1.40

Newsgroup: comp.sys.atari.st
Date: 1991-06-14 17:25:49 UTC
From: longj@lonex.radc.af.mil
Message-ID: <1991Jun14.172549.4256@lonex.radc.af.mil>
Source record: 231174

I noticed the sources and diffs for the ST version of GCC1.40 in the new gnustuff directory at A.A. (Thanks to Graham for the neat re-org!!)

Before I go to the trouble to try and compile it, has someone else already got the ST version of GCC1.40 compiled up, and could they please post it to A.A??

Thanks to all, and again, public thanks to Graham Higgins for his work in getting the gnu directories on A.A in such nice shape!

Jeff Long

449. SPECTRE GCR (mac emulator for ATARI ST) For sale

Newsgroup: comp.sys.atari.st
Date: 1991-06-14 22:31:40 UTC
From: wngai@net1.ics.uci.edu
Message-ID: <285943CC.7010@ics.uci.edu>
Source record: 231153

Hi! As the subject title have implied, I've a SPECTRE GCR for
sale. There's nothing wrong with it. The reason I am selling it is because
I really have not use for it. I am asking for $300 or best offer. If you
are interested, please email me.

Thanks,
Wayne

450. Re: Lattice C

Newsgroup: comp.sys.atari.st

From: jimomura@lsuc.on.ca
Message-ID: <1991Jun14.224655.18224@lsuc.on.ca>
Source record: 231154

In article <1991Jun13.024614.7493@garfield.cs.mun.ca> david10@garfield.cs.mun.ca (David Churchill) writes:
>I just purchased a copy of Lattice C (v. 3.03.02 (c) 1986 . . . hey, for $20
>CAN used, I can't complain :-)), and I have a few questions (my apologies if
>all of these questions were answered recently on the net) :
>
>1) What are the major differences (improvements) to the compiler in its latest
>version (v. 5.01?)?

Well, first, you don't even have the "latest" revision of version 3. In my version 5.06.01 manual it refers to conversion of programs from version 3.04. So it would seem that they had at least 1 more major revision even within the 3.nn series since yours was last upgraded.

Now as for version 5.nn, well the biggest reasons to upgrade are:

1. Support for ANSI code. The documentation is a tad unclear whether it support 100% of ANSI or just "almost", but it looks complete to me. Unfortunately this has made it somewhat difficult for me to decide what state I'm going to leave some of my source code since I use a few "old K&R C" compilers such as "Small-C" for CP/M work and Microware 6809 C for OS-9 work and Sozobon C. I think I'll convert the most Atari specific commercial code I'm doing to Lattice/ANSI C and leave the rest mainly in "old C". But if you plan on a carreer as a programmer, I suggest that you have complete ANSI C compatibility as soon as possible.

2. Support for newer POSIX calls. This is an independent matter from ANSI C, but it's the same reasoning. It's "the future" and if you're going that way, you want the upgrade.

3. Better support of TOS/GEM. This I'll have to guess a bit at. Some of the stuff looks the same to me as the stuff covered in the Abacus books. Other things look different and possibly new. I think the VDI has been extended a bit in TOS 1.4. Certainly the STE specific calls like the support for the sound output daemon are new.

Beyond that I'll have to speculate that there are probably fewer bugs than what you have and I expect a bunch of new compiler options. I don't know if your compiler creates code other than 68000 specific code. This compiler has switches for '020 and '030 as well as support for 68881 and 68882 math co-processors. They also claim a better set of libraries generally due to re-coding

in assembly language, so most programs should turn out smaller and
faster than before.

>2) Is Metacomo still in business? If not, who is carrying the line?

I've been in contact with Goldleaf in the US (415) 257-3510.
In fact, I'm supposed to call them back Monday to discuss upgrading
my 5.06.01 to 5.06.02. They haven't received the upgrade packages
from HiSoft. It may be relevant that HiSoft in England seems to
be in control of the situation overall now. I don't know if
Metacomo still exists, but it probably isn't relevant. You'd
better call Goldleaf though and see what arrangements you can amke
for upgrades. You may have a problem. I called Goldleaf *before*
I bought my Lattice just to make sure there wouldn't be a problem.
But I'm at least starting with a HiSoft release.

>3) Is an upgrade path available, and is it worth it? (at the moment, I'm just
>writing small, uncomplicated programs for use on a UNIX platform. Since I can't
>always get through to the system via modem, why not use the ST?)

I must sell this item:

RGB color monitor SC1224 for the ATARI ST,STE,MEGA.

$175.00

Hardly ever used, only used for game playing otherwise covered
always from dust. Perfect view, believe JVC made these for ATARI.

Leave me mail for more details.

chuj@horton.colorado.edu

454. Re: set-up for Practical Peripherals 9600 modem?

Newsgroup: comp.sys.atari.st
Date: 1991-06-15 05:17:41 UTC
From: saj@chinet.chi.il.us
Message-ID: <1991Jun15.051741.7942@chinet.chi.il.us>
Source record: 231191

Between postings and email, I think I have the story straight: RTS/CTS flow control (between computer and modem) works properly under TOS 1.2, but not under TOS 1.0, 1.4 or 1.6. The problem is thus a software one. I luck out on this one because I use TOS 1.2, and wasn't planning to upgrade TOS on the machine the modem hooks to anyway. There have been several references to patch programs to correct the problems (and I don't know what the problems are: just from morbid curiousity, I'd like to know what happens wrong). So far, nobody has named a patch program though. I suspect these may be among the files that still don't have descriptions on atari.archive, because a scan of the file list there didn't turn up anything obvious.

Bottom line: for general interest, please name a RTS/CTS patch program.

Steve saj@chinet.chi.il.us

457. Re: GCC 1.40

Newsgroup: comp.sys.atari.st
Date: 1991-06-15 12:13:51 UTC
From: gjh@hplb.hpl.hp.com
Message-ID: <GJH.91Jun15131351@polly.hpl.hp.com>
Source record: 231187

++ I noticed the sources and diffs for the ST version of GCC1.40 in the
++ new gnustuff directory at A.A. (Thanks to Graham for the neat re-org!!)

Hold hard there boyah! Not finished yet. The sources currently available on A.A. are only positioned for testing, not yet testED. Testing will require compilation. The only thing I've managed to compile so far are the main GNU libraries gnulib16/32 and iio16/32 and their gdb versions.

++ Before I go to the trouble to try and compile it, has someone else already
++ got the ST version of GCC1.40 compiled up, and could they please post it
++ to A.A??

I will post a set of 1.40 binaries which I got from a UK BBS. No, I haven't been able to cross-compile 1.40 yet, so I can't vouch for these binaries, except to say that I used them to compile the library sources on my ST.

Cheers,

Graham

458. Vortex Hard Disk Drive question

Newsgroup: comp.sys.atari.st
Date: 1991-06-15 13:21:21 UTC
From: iws9060@eva.fmi.uni-passau.de
Message-ID: <1991Jun15.132121.19008@forwiss.uni-passau.de>
Source record: 231182

Hi there!

I have some questions to all of you in Netland:
How good is the Software that comes with Vortex' Datajet drives? It is
specially written for them and I do not know if it is comparable to
ICD Tools or SCSI Tools. In a German mag (PD Journal) I have read that
using SCSI Tools on Vortex drives may cause loss of data. Is this true?
If so, then why does this happen? Would you advise me to buy a new controller
instead of going on with the one built in?

Hope there is someone who knows.

459. TCB soundtracker / ST User??

Newsgroup: comp.sys.atari.st
Date: 1991-06-15 15:40:58 UTC
From: adm2@doc.ic.ac.uk
Message-ID: <1991Jun15.154058.19205@doc.ic.ac.uk>
Source record: 231185

Hi all,

I've just been down to the local newsagent,and I see that the latest
ST User has a ,so called,FULL version of the TCB tracker! Can this be so??

What I would like to know is how full a version is the full version??

I have the demo version of the tracker,is this ST user version just a
fuller version???

Does it support MIDI??

Does it come with playback routines???

In short has anyone brought the latest ST User and can tell us what comes on
the cover disk in terms of the TCB tracker??

Enquiring minds want to know...

Bye for now,

Alan.

460. Re: How is Atari doing in Europe?

Newsgroup: comp.sys.atari.st
Date: 1991-06-15 16:16:14 UTC
From: grahamt@syma.sussex.ac.uk
Message-ID: <5360@syma.sussex.ac.uk>
Source record: 231190

From article <1991Jun14.010821.9903@noose.ecn.purdue.edu>, by
yegerleh@vivaldi.ecn.purdue.edu (James D Yegerlehner):
> I don't think Atari is making much of a splash over here (yet?)
> with the new STEs and TTs, but can any of you guys over in Europe
> say how the new machines are being received there? Is Atari
> maintaining the significant market share that it once had?

I'm fairly sure Atari's market share in the UK is declining. Most STs
here have been sold as games machines, and judging from the relative
amounts of software in the shops and the number and thickness of
magazines on the newsstands, the Amiga's winning hands down in that
arena.

Anything else has been niche marketing. The TT is more expensive here
than in some other countries, partly because Atari don't expect to sell
many. The Mega STE hasn't even been released here yet - it's just been
delayed even further until the beginning of July.

Atari are still selling a fair number of STFMs (still!) and STEs, and
the existing number of installed machines means that games and music
software will continue to be produced here, along with the occasional
non-games product. Also, Atari UK have started to advertise the ST as a
'serious' computer again. But, in my opinion, it's too little, too
late. The best is not yet to come.

Graham

461. Story of the demo folks

Newsgroup: comp.sys.atari.st
Date: 1991-06-15 16:31:59 UTC
From: boyd@nu.cs.fsu.edu
Message-ID: <1991Jun15.163159.3992@mailer.cc.fsu.edu>
Source record: 231188

In article <2865725@MVB.SAIC.COM>, steveg@cseic.saic.com (Stephen Harold Goldstein) writes:
>
>Now can anyone tell me just who these guys are that wrote things like
>the WHATTHEHECK and Life's a bitch demos? The demos are pretty neat
>but I'm concerned about references to 'ripping' sounds from commercial
>games and 'copy parties' in their 'scroll texts'. Are these demos nothing
>more than cut and paste jobs of stolen code and artwork?

Well, most of these guys are/were pirates, more specifically crackers. A cracker is one who removes copy protection from a piece of software, so it can be more easily distributed via BBS's. After the program is "cracked", these folks sometimes put a little graphic demo at the beginning, stating which "cracking group" did the work, and perhaps a scrolling message (usually containing hellos to other cracking groups). All the "scroller" type demos originated from this. As they got more and more complex (remember that they had to be able to coexist with another program, so they are generally small), and as competition increased they got more and more impressive (in terms of graphics/sound). Some common techniques were to "rip" sounds from games or other demos, and sometimes graphics backgrounds or sprites. At some point, a cracking group organized and produced a full disk of these demoes (I believe the first was the Union demo, still one of the best). Many others followed, including the ones you have mentioned. They usually consist of offerings from many "groups", collected together under some sort of common menu program. The theft of music/graphics from copyrighted stuff is going down, although using stuff found in other demos is still common (it is usually of better quality).

Now, interestingly enough, many "cracking" groups have become "demo" groups. They have given up cracking and pirating in favor of writing demos. One reason for this might be increased legal awareness developing in europe of software pirating. For whatever reason, some of these folks are now being employed to write games and sound/graphic tools (for example, the TCB Soundtracker, named best music program in europe, was written by The Care Bears, a former cracking group). Also, some "demo" groups have formed that have no history of pirating. At most european computer shows, there is a "latest and greatest" demo competition, with software companies looking on. There are also some other interesting categories, like "best demo written in 24 hours". I have been seeing less "scroller only" type entries, and more snazzy stuff, like real time 3D (although just about all the demoes have some sort of scrolling message).

Please note that most of these folks are REALLY young (like 14, for chrissake!). Kind of humbling, huh? Anyway, almost all coding is done exclusively in assembly (I have seen reference to the TURBOASS assembler, which has been discussed recently here on c.s.a.st). Thus, I would say that these demos

are much more than just "cut-and-paste" jobs, but they do have a definite ancestory to software cracking. With the advent of "demo only" type groups, offers to share source code and have "demo parties" are becoming more common. One groups usually hosts a party, inviting members from other groups. Zillions of Cokes and Doritos later, a new demo disk emerges. At some point in the future, I am going to try to attend one (and pretend I broke my two typing fingers in a bench vise :-). I am very curious as to just how they do all that stuff, and I hope to come back with some disks of source.

As someone pointed out on the net, most of these demos work at a very low level. Thus, you should not expect to see standard GEM windows, or expect them to work on all computers made by Atari. What you should expect is some mind-blowing graphics and sound which push your particular machine to the limit (I can't wait until some TT specific ones come out, that should be impressive). By the way, almost all of the "full disk" type demos contain at least one hidden demo (the one for the Union demo is incredible, and was the root for the TCB Soundtracker). Usually one of the scrolltexts will tell you how to invoke it.

In article <VJJe41w164w@admiral.UUCP> slammy@admiral.UUCP (Dave Litchman) writes:
You will have almost the same amount of free memory with a hard drive as
without. The driver only takes up a few bytes. If you could run Word
Perfect and Timeworks DTP before (which I suspect you could) you can
still run them with a hard drive, only MUCH, MUCH faster.

Careful here ... the ICD boot system I have does take up a lot of
memory if you use the disk seriously (extra 500-1000 folders). I have
up to now lost ~100K (out of 1Mb (yes I know I should get more :-))
with all caching off.

Team Leaders' Thoughts

Welcome Team Members! This first issue will be distributed publicly
so that others will know exactly what this is all about. The following issues
will be distributed e-mail to members only - that is the privilege you get
for being a member! If you haven't received or filled out a questionnaire,
please let us know so that we can get one to you. This tells the team leaders
about you so they can decide how you can be helping the Support Team.

Each of you that have filled out a questionnaire will notice that you
have been listed to do specific volunteer jobs for the team. The jobs that
you were given was a result of the team leaders looking over the questionnaire
that you filled out and figuring out what you you could do best for the team.
If we were mistaken and gave you a job that you cannot do, or if you feel
you can do many other things besides the things that were listed for the
support team, please inform us by the Atari SIG address located on the cover
page of this newsletter.

A question that will soon arise is how often will a team member have
to contribute? This all depends on the job that you have agreed to have.
If you contribute online magazines, you should do it every week- that is unless
you have worked out an agreement with someone else to take some of the

burden. If you agreed to search through online magazines, Usenet, and BBS', you should do it when you read these information sources and just capture any news or information that seems important to you as you go along. If you decide to review products as a support team member, you should do it as often as you can- even monthly if possible. And if that isn't specific enough- just do it as often as you can and as best as you can.

There are a few things that you should remember. The reason for the assigning of jobs, etc. is so that we can have a real great information source covering every area. Everyone will know exactly what to do so they will be able to contribute without trying to guess what needs to done. In the first announcement of the "16/32-bit Support Team", it was said that this team works by everyone doing their part in order to get the most. If everyone does their job, they will be able to get a lot of information. Just imagine- one person contributing tips and tricks, a few people contribute reviews, another person contributes online magazines, and yet another contributes Usenet information. You get all of these just because you contribute BBS news or any other job that you have chosen. Meanwhile, the person contributing online magazines that you are reading is getting everything you are but also the information you are contributing. It is a good system and it works! The amount of information you receive is determined by the amount of support members so tell your friends to join!

This Support Team is very unique since the only requirements to join is that you have commitment to the team (meaning that once you say you will do a job, you will do it) and you have at least an e-mail box address that is on Free-Net or can receive e-mail through Internet. If you have an e-mail box on Compuserve, you can also join the Support Team without even having to access the Cleveland Free-Net Computer system.

If you have Cleveland Free-Net access, you'll be able to obtain any of this information anytime that you wish. You will also be the first to know about it. But if you don't have access to the Cleveland Free-Net, do not frat! You can always request a contribution listed in this newsletter from the Atari SIG on the Cleveland Free-Net. The Atari SIG will make sure you are a team member and then send you the contribution through e-mail to your mail box.

Spread the word around about the 16/32-bit Support Team! Get your user group involved! And DEFINITELY contact us by the addresses above if you have any questions about any of this.

Thanks.

Marc Lombardo, Len Stys
Atari 16/32-bit Support Team Leaders

-
HIGHLIGHTS!
-

The Highlights of Contributions

The main highlights for this newsletter is the Atari Computer Files area completion. Even though we are not allowed to have files on-line, we have come up with a clever alternative.

You can now access the "16/32-bit Computer Board" through the Support Area. Just type "go atari16" and you'll be there!

There are many NEW online magazines being posted. There is also some information on the Summer CES at Chicago. There has also been several reviews uploaded within the last month.

-
EVENTS!
-

Upcoming Events

(if you go, take notes and report what went on!)

June 15-16 PACIFIC NORTHWEST ATARIFEST June 15th and 16th at the Steveston Senior Secondary School, 10440 Number Two Road, Richmond B.C. Canada. This is the first major Canadian Atari show west of Toronto, and is just across the US border from Seattle. Contact Terry Schreiber at (604) 275-7944, T.Schreiber1 on GEnie, or Node #505 Atari West BBS on F-Net.

June 29-30 The Great Lakes Atari Computer Users Conference at the Mercyhurst College Campus Center (501 East 38th St.) in Erie, Pennsylvania. GLACUC, call Patty Marshall at 412-225-8637.

July 20 Blue Ridge AtariFest, Noon to whenever, Saturday July 20, Westgate Shopping Center, Asheville, North Carolina, at I-240 and US 19-23. Contact B.R.A.C.E, Van Estes, 704-685-8358.

July 27 MIST AtariFest III in Indianapolis, Indiana on Saturday, July 27th, sponsored jointly by the user groups at Indianapolis and Bloomington known as MIST (Mid-Indiana ST). Held at CADRE, Inc., 6385 Castleplace Drive, Indianapolis, IN. Bill Loring, 812-336-8103.

Volunteer Job Listing

The following are things that need to be done on a continuing basis.
If you think you can do any of these for the Support Team, please tell the
support team leaders by the Atari SIG address of xx004 (complete address
located on cover page of newsletter).

- Writing reviews on software, hardware, and public domain files that you own
or recently aquired.
- Retyping articles and reviews from your user group newsletter.
- Retyping articles from AIM magazine or other user group newsletters.
- Retyping press releases or product summaries.
- Searching through online magazines and capture valuable information and
reviews from it.
- Searching through BBS' and capture valuable information and reviews from it.
- Searching through Usenet and capture valuable information and reviews
from it.
- Updating Support Team on anything new happening on pay computer systems.
- Posting of online magazines weekly.
- Writing an article about an Atari computer show that you attended.
- Writing short summaries of new public domain software that has been
released.
- Updating Support Team on new files uploaded to the atari archive ftp site.
- Writing tips and tricks for other Atari ST users.
- User Group Newsletter recopied in ASCII form.

And Anything else not listed.

-
CONTRIBUTE!
-

Contributing Information

If you do not have access to the Cleveland Free-Net, all information should
be sent to the Atari SIG address located on the cover page.

If you do have access to the Cleveland Free-Net, each contribution should be
contributed to the appropriate place (eg. online magazines should go in online
magazine section, reviews should go in review section).

All information or news being contributed that does not have a specific place
should be posted on the "16/32-bit Computers Bulletin Board".

Speed and cache status are controlled by the lowest two bits of the
byte 0xffff8e21.

> terminals over one serial line (the terminals are in the form of windows).
> You can set font sizes, cut and paste, file transfer, etc. It consists
> of an ST end and a Unix end (which must be compiled for your particular
> system).

Unix windows uses kermit protocol and it has hosed every download I
have tried. Now I know the authors wouldn't release it if it didn't
work, so I must be doing something wrong.

Also, I can't seem to get Chamelian, Maxidisk, Cpanel++ and The_Accessory
to work with each other.
1) Maxi seems to kill one of them.
2) Chamel won't load Cpanel or The_Acc
3) either maxidisk or quikst or something (tos 1.4?)
is making my publisher not do the "rulers" correctly, the hair-lines
don't show up.

DOES ANYONE KNOW HOW TO DUMP TOS TO A DISK TO USE WITH QUIKTOS?

HELLO, IS ANYONE OUT THERE?

Scott

469. Atari 1040STF and SC1224 for sale

Newsgroup: comp.sys.atari.st
Date: 1991-06-16 00:21:05 UTC
From: es2a+@andrew.cmu.edu
Message-ID: <gcKevly00YU68dAaZI@andrew.cmu.edu>
Source record: 231194
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

Well, I sold the computer, but the monitor remains.

I have an SC1224 color monitor (original JVC, crisp&bright,
better picture than modern SC1224s). It handles 50Hz just fine (usually
used when running demos or European games) with no adjustment. I'd like
$200+S&H for it. A new one would set you back significantly more than
$300 even by mail order.

I have the following items (Atari ST software) for sale:

* TigerCub.....$ 45
* Roland MT-32 Editor/Librarian.....$ 30
* Dr T's MIDI Recording Studio.....$ 30

* Epstart (Epson driver for Mac/Spectre).....$ 35
* Switch/Back + hardware device.....$ 30
* SLICCTOP (desktop replacement).....$ 30
* ST Control.....$ 25
* dBMAN (dBASE compatible database).....$ 25
* GST Assembly.....$ 25
* Backup! (HD backup).....$ 15
* Timework SwiftCalc (spreadsheet).....$ 20
* Tempus (super fast text editor).....$ 20

* Mean-18 (golf).....$ 5
* Golden Path.....$ 5
* Sky Fox.....$ 5

Price does not including shipping. Everything are in excellent condition. I
have the original box, disks, and manual for all programs above. If you don't
like the asking price, make me an offer.
Thanks,
-Steve

476. help on upgrading Atari STFM to 2.5 Megs wanted (please!)

Newsgroup: comp.sys.atari.st
Date: 1991-06-16 13:14:40 UTC
From: CHT510@SATURN.UKC.AC.UK
Message-ID: <9106161314.AA15971@lilac.berkeley.edu>
Source record: 231102

Hi,
wondered if anyone who has upgraded an Atari STFM with DRAM's could help
me. I was planning on putting an extra couple of MEG in over the summer
and wondered if it was just as simple as soldering 16 * 1 MEG chips in.
I know that the STE is incapable of recognising 2.5 Megs of memory without
the aid of 'simmfix'. Is the STFM similarly affected when upgraded with
DRAM's ?
One last thing. how fast does the access time of the DRAM's have to be.
Is 120 ns fast enough or does it need 100ns/80ns ?

I would be grateful for any help.

The ICD booter uses a lot more memory that most, and some this is not
needed from looking at the code, German Text, and 'TT' support ?
Try the Supra Booter , this will give you far more memory.

>Bryan_Jones_Woodworth@cup.portal.com

OK, DMJ_GIF IS slow, but it produces very high quality (so does v.1.0).
But v.1.0 has lots of bugs and I am missing some options in it. That means,
v.1.0 is unable to handle interlaced gifs, it does not have a default
proportional convert mode and it won't run in 50Hz mode correctly. I'm sure
that at least one or two of these are changed in v.2.0. So, if you have it,
please upload it to atari.archive.

479. Re: inaccessability of GEM on boot

Newsgroup: comp.sys.atari.st
Date: 1991-06-16 17:14:31 UTC
From: Rod.Fulk@therip.FidoNet.Org
Message-ID: <677093104.0@therip.FidoNet>
Source record: 231118

```
Its because Gem doesnt get initialized until after the machine is booted..
You need to start GEM programs with startgem type programs or if you have a
tos 1.4 or newer such programs can be installed as auto programs..
^^^^^^^^^ ^^^^^^^^^^^^^^
I am highlighting these cause this is exactly what you do in tos 1.4 or newer..
Running shells from the auto folder will give you a little extra memory but
wont allow access to gem..

480. 8 bit 5 1/4 drive

Newsgroup: comp.sys.atari.st
Date: 1991-06-16 17:59:41 UTC
From: selick@bucsf.bu.edu
Message-ID: <83937@bu.edu>
Source record: 231106

I recently purchased an 800xl with a 5 1/4" floppy drive, and I wantev to know if this drive could be used to read IBM disks? Apple][disks? Atari 800xl disks? Commodore 64 disks? I also have Spectre GCR if that will help the apple][disks.
later,
Steve

I was planning on attending, oh well. I think it's time to throw in the
towel here. It's been a fun but frustrating 10 years since I bought my 800,
and 5 since I bought my ST, but I give up on the TT.

Only God knows what I'll buy next though...

Scott Le Grand aka sml108@psuvm.psu.edu

482. ST software for sale (good prices!!)

Newsgroup: comp.sys.atari.st
Date: 1991-06-16 19:04:16 UTC
From: tgingric@magnus.acs.ohio-state.edu
Message-ID: <1991Jun16.190416.27419@magnus.acs.ohio-state.edu>
Source record: 231107

I have the following ST software for sale.

Turbo ST 2.?? $10.00
CodeHead Utils $10.00
NeoDesk 3.0 $17.50
BattleHawks 1942 $ 7.50
StarFleet I $ 7.50
Breach $ 7.50
STOS (Game Creator) $12.50
Quartet (Music s/w) $17.50
Dungeon Master $ 7.50
Arkanoid $ 5.00
GhostBusters $ 5.00
OutRun (NO DOCS) $ 5.00

Wico Joystick $10.00 (VERY NICE joystick with a comfortable molded grip)
Details: All software comes with original packaging & documentation (except Outrun).

TERMS: First email message offering to purchase an item for listed amount will have dibs on the item. If you don't think these prices are fair, email me a bid, best offer by 23 Jun 91 will be accepted.

When we agree on a price, mail me a check for the total amount + 2.50 for shipping. When I receive your check, I will mail the software.

Thanks

> of help for the people out here whe love GCC but hate TEX!

sorry, all the documentation, both from FSF, and atari specific
documentation from Frank Ridderbusch are in TeX format. It should be
easy enough to run them off though, or view them directly, as they are
just text files.

484. Unix Windows/Mono Monitor/Auto files/etc...

Newsgroup: comp.sys.atari.st
Date: 1991-06-16 22:58:04 UTC
From: scott@cs.odu.edu
Message-ID: <SCOTT.91Jun16175804@brahma.cs.odu.edu>
Source record: 231109

Hmmmm... To follow up on my previous post:
1) ICD's copyfix program will cause "The_Accessory_ to crash my system when it is loaded via Chamelian.
2) ACCs seem to pick and choose where they want to look for their conf/inf/rsc files. When loading "Cpanel++" -- if it can't find its .set file, it doesn't have the proper defaults. Look at the mouse setting-- when you finally get to the mouse menu, none of the digits 0-4 is highlighted. The mouse still works, sure, press the button and wait for 15 seconds... so highlight 4 so the mouse would work again. BTW, why would anyone NOT want setting number 4? I believe it also asks you for the date as a default and also defaults to a 512 ramdisk drive d: and 50hz screen. Those are all opposite (with exception to the 50hz) that I would think that they would be set as a default.

3) ACCs seem to want to spit forth text when they are loaded. Sure, this may work when boot loading, but when chamelian is used, it hoses the gem screen.

4) Well, it finally happened and like a fool I didn't save the files. My monochrome monitor has a nice thin, single line running down the center of the screen. Since I believe that this has been hashed into the ground and appears to be an easy fix-- I would like to do the fixes myself. However, even though it has been posted so many times, I never saved the docs. COULD SOMEONE POST THIS YET AGAIN? Also, what about overscan? I figure that since I am going to be in there, I might as well do everything I can.

5) It appears that turbocts.prg will cause Publishing Partner to NOT load files.

6) LLAMATRON is great, esp the samfox sample, I just wish it were longer and the game not so easy-- :-) ps: I played robotron.prg until it quit, both with one joystick and with two (it will quit every time when you get so far: "What a crock!").

7) Does anyone know of a version of UW that will work with a color monitor? and along with this, why "bigscreen" doesn't seem to allow you to increase the "x" axis more than 1 or two steps. ie: Whenever I try to use/simulate a 1024x800 screen, and I open up a gem desktop window with a dir, it loses many of the files. I have not tried this in color with a 50hz screen, but I think the flicker would kill me anyway.

8) Great, I purchased Blood Money and the demo was what made me buy the "Real Thing" but guess what, either everyone's disk drives around here are out of alignment or these disks have some sort of protection on them that is REALLY good-- I bought it and I still can't run it.

9) Hello? Does anyone use STOS? With TOS 1.4? HOW ARE YOU DOING THAT? There was a guy on here from canada who said he knew of the patch for tos 1.4 but that was last November/December and I didn't have tos 1.4 then so I told him I wasn't interested. I know he didn't make the patch, so there are at least 2 people in the world who at one time knew about how to make STOS work with tos 1.4. I need to find them or anyone else who knows how to fix STOS. Now, I am not talking about the STe fixes for tos 1.6-- I need the ST fixes for tos 1.4. No, I haven't seen any files at atari.archive concerning this fix, the STOS files there are for the STe.

Thank you for your support.

Scott

485. Re: Mint ? (Eric Smith to replace Bob Dobbs in character set)

Newsgroup: comp.sys.atari.st
Date: 1991-06-17 03:00:54 UTC
From: warwick@cs.uq.oz.au
Message-ID: <1977@uqcspe.cs.uq.oz.au>

>(Dave Gymer) writes:
>]]Once you get [Mint] running, it _is_ great! (Perhaps someone would care to
>]]replace the piccy of Bob in the character set with one of Eric Smith?

>Well at least it could be said that Eric had contributed more to the Atari
>commmunity than Dobb's did. If Eric looks like an Acid House smiley then the
>characters would also have a general application.

>The problem would be if one process changed the characters to Eric but another
>wanted them as Bob. Can Mint cope with such a scenario? Would the character
>definitions be stored with the context of each process?

I think the best thing would be to have the Eric Smiley active by default
for programs running in the MiNT domain, while retaining the Standard, but
less socially acceptable Smoking Bob in the TOS domain. Also, an additional
MiNT library call would be necessary, since some programs will need to run
in the MiNT domain AND use the Smoking Bob characters.

int Pbobacid(flag);
int flag;

If flag&1==0, set the current process's CHaractEr Extra Set Extentions (the well
documented "CHEESE" characters) to follow the Bob convention. Otherwise, the
IBM-compatible Smiley convention will be used. Returns the currently selected
state.

487. DOS emulator for Atari STE

Newsgroup: comp.sys.atari.st
Date: 1991-06-17 07:19:31 UTC
From: theo@cs.vu.nl
Message-ID: <10227@star.cs.vu.nl>
Source record: 231112
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.ibm.pc.hardware

I've heard that in Holland is no (not yet) hardware DOS emulator available
working with the Atari STE. It depends on how many configurations will be sold.
Does somebody know if this is true, or is there an emulator for sale in an
foreign country.

>maintaining the significant market share that it once had?

Hi,

here in germany ATARI has it's best place on earth, I think. The Mega STE
is going good, since the Mega isn't sold anymore. It's design has been
accepted by the customers and we now have quite a few megabytes of software,
supporting the new features of these machines. The TT, I think, is going
quite well too. If you have a homecomputer and want to upgrade, but you hate
IBM-clones and don't have as much money to buy a SUN, the TT is a good
alternative. Many students from our University's buy a TT.

Bye.....Michael

In <1544@grit.cs.utexas.edu>, Troy Carpenter writes:

>In short, Atari is doing very well in Europe, as far as I could tell.
>(The only Mac store I saw in my 3 week stay was in Copenhagen!)

That's no wonder. Apple Europe is a very strict company. You can only buy
a Mac at an Apple Center, which is a Company only selling Apple products,
having full support and offering courses for they're customers. In Hamburg
we have, I think, 4 Apple Center and they all are quite big, but are making
fat commercials. This is all done by Apple Europe.

Bye......Michael

>using SCSI Tools on Vortex drives may cause loss of data. Is this true?
>If so, then why does this happen? Would you advise me to buy a new controller
>instead of going on with the one built in?

When I tested their software (in 1990), it was not completely AHDI3-compatible.
They should have fixed this now. Using SCSITool to partition Vortex HDplus
drives may cause total data loss, that's right. This is due to a
somewhat peculiar hostadapter design in the HDplus series. It is not
SCSITool's fault. Since you're concerning Datajets, this doesn't apply to
you. Datajets will run fine with the SCSITool software or any other driver,
including mine.

Message-ID: <1991Jun17.121601.4491@forwiss.uni-passau.de>
Source record: 231117

hi
i just got a TT and have some questions.
maybe that most of them already have been discussed, but as i had no TT i
did not pay attention.

My version of Mint (0.6) does not seem to work with the TT is there a version
that does ?
Is there a switch for gcc (my version is 1.39) to use 68030 code, to use the
co-processor and the full TT memory ?
I tried to connect my external 5 1/4'' floppy i used with the st to the tt
but failed. any ideas why ? (i just pulled the plug out of the st
and into the tt, but the tt couldn't handle it. :( )
Is there already any nice tt - pd -software, and where can i ftp it?
Does anyone have some TT documantation, e.g. new tos-routines and
hardware - registers ? If you only have them on paper, i would give
you some money for stamps, if you send them to me. (send e-mail for
adress)
Is there a version of minix running on the TT?

thanx for any replies,
carsten

carsten friedrich, e-mail: friedric@unipa.fmi.uni-passau.de

493. Upload to atari.archive: cookie.prg

Newsgroup: comp.sys.atari.st
Date: 1991-06-17 12:16:02 UTC
From: ralph@laas.fr
Message-ID: <RALPH.91Jun17141602@orion.laas.fr>
Source record: 231147

I just uploaded cookie.prg to the atari.archive server. It provides a
default Cookie Jar for those poor STs that don't have one (i.e., TOS < 1.6).
I picked up from cs.uni-sb.de. Just put it in your AUTO folder before
MACCEL3.PRG.

Cheers,

494. ECOLOGY program: help!

Newsgroup: comp.sys.atari.st
Date: 1991-06-17 12:46:15 UTC
From: doucet@laas.fr
Message-ID: <5895@laas.laas.fr>
Source record: 231149

I recently downloaded from a.a something called ECOLOGY.LZH,
and unlzh'ed it, giving:
55919 Nov 20 1985 eco.prg
32512 Nov 20 1985 ecoad.art
32512 Nov 20 1985 ecogene.art
32512 Nov 20 1985 ecoload.art
32512 Nov 20 1985 ecomain.art
32512 Oct 26 1990 ecotext.art
32512 Oct 26 1990 ecoworld.art

Once installed on the 1040, I ran ECO.PRG :
a nice panel with quotation from Ch. Darwin
appears, together with a joyful music.

After some minutes have passed, nothing else happens but
the music which continues...

I tried mouse buttons and keyboard keys
(with or without Ctl / Shft / Alt)
and still nothing new...

Has anybody tried this program out and got an idea
about making it go further ?
Maybe I'm not patient enough ?

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available. Finally, there is the Lynx (a game machine) and the Atari
ATW.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources
```

CSAST
What sort of articles would interest people reading comp.sys.atari.st?
==========

The most interesting articles are technical articles, impressions of
software/hardware, information on Atari user-groups and shows, or helpful
hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better
than...', especially when cross-posted outside of comp.sys.atari.st. If
you don't know how to eliminate other newsgroups from a reply to an article
which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local
distribution of comp.sys.atari.st. Those outside the United States have
little desire to read about that neat bit of [hard/soft]ware you're selling
when you live in the U.S.A. If you don't know how to restrict distribution of
a posting, ask your systems administrator.

Many articles are in the form of "How do I...?" or "Where do I...?" In this
article, I will try to answer some of the most-often asked questions.

PD
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

For Mail Service:

archive-server@twitterpater.Eng.Sun.COM:

(Panarthea has been moved to a new system called Twitterpater.)

Twitterpater holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@twitterpater.eng.sun.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

Bart help may be attained by mailing atari@atari.archive.umich.edu and
enclosing the word 'help' in the body of the message. If
you are from a uucp site, please enclose this statement also

'path host1!host2!....', where host1!host2!... is your path.
Please read the help file completely before you ask questions,
and then send any you may have to jon@atari.archive.umich.edu. Jeff
Weiner will only forward them to Jon, so please save him the time.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu

via JANET. Mail access is available from within the UK - send mail to
archive-server@lancs.pdsoft for information.

For anonymous FTP in Europe: ftp.Informatik.Uni-dortmund.DE
[129.217.64.63]

Some selected Atari ST software is in the directory pub/comp/atari-st.

NOTE: The server has moved from unido.informatik.uni-dortmund.de. FTP
requests to the old address direct you to the address given above. I do
not know the current status of the old mailserver, but would appreciate
learning if it still exists.

For anonymous FTP in Europe: cs.uni-sb.de [134.96.7.254]

Contains the most interesting tools of the german PD-scene, most of the GNU
programs ported to the ST (including ports of emacs and bash and an extended
version of bammis library for gcc) and also ports of software posted to
comp.sources.unix, alt.sources and comp.sources.misc.

For anonymous FTP in Europe: archive.cs.ruu.nl
[131.211.80.5]

How to get ATARI-ST/index from the archive at
Dept. of Computer Science, Utrecht University:

NOTE: In the following I have assumed your mail address is john@highbrow.edu.

Of course you must substitute your own address for this. This should be
a valid internet or uucp address. For bitnet users name@host.BITNET
usually works.

by FTP: (please restrict access to weekends or evening/night (i.e. between
about 20.00 and 0900 UTC).

ftp archive.cs.ruu.nl [131.211.80.5]
user name: anonymous or ftp
password: your own email address (e.g. john@highbrow.edu)
cd /pub
don't forget to set binary mode if the file is a tar/arc/zoo archive,
compressed or in any other way contains binary data.
get ATARI-ST/index

by mail-server:

send the following message to
mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

BITNET users:

LISTSERV@UOGUELPH.BITNET

Mail messages with the contents HELP will bring you some usage information
and GET INDEX PROG-A16 will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

ARCS
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are
binary files which may contain one or more other files in a compressed format.
Archive files usually take up less disk space, and for this reason have
become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive
program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

These programs are all available via FTP from the atari.archive server, in the
/atari/archivers directory. Recommended files are:

arc.ttp - needed to extract the other archivers, once.
arc_602.arc - latest version of ARC, with the most fancy features

and quite a lot of documentation
lharc.arc
zoo_bin.arc

Julian Coleman recently (December 1990) uploaded an archive starter pack to the atari.archive server. His announcement reads:

" I have just uploaded an archive starter pack to Atari.Archive. It contains the following :

arc / lharc / uud / uue / zoo
U. Michigan monthly posting (05 Dec 90)

The file is 'starter.tos' and is in the form of a self-extracting lzh archive, so only needs to be downloaded (in binary mode !) and run. The archive contains sudirectories and needs about 350k when extracted."

This is probably the easiest way to get hold of the various archiving programs if you have access via FTP and can transfer the binary file to your Atari ST. The program is located in the main directory (ie. /atari/starter.tos)

There are also several GEM programs which act as 'shells' for the archive programs. The most popular are Shareware offerings, also available on atari.archive server. They are:

arcgsh35.zoo - written by Rainer Klute. e-mail will reach him
at klute@irb.informatik.uni-dortmund.de or
klute@unido.uucp, or klute@unido.bitnet

arcshl23.arc - written by Charles Johnson

Both are located in /atari/archivers

The GEM shells are recommended for inexperienced users (and appear to be quite handy for the experienced user as well!) They require a copy of the archive program -- in other words you need BOTH the GEM shell *AND* the archive program in order to use the GEM shell.

Documentation on the use of the archive programs should accompany the archive files mentioned above. To use ARC.TTP in order to extract these files, use the command line:

xh xxxx.ARC *.*

where 'xxxx' is replaced by 'arc_602', 'zoo_bin', etc. For example

xh arc_602.arc *.*

will place all files within the arc_602.arc into the current directory. It assumes you've clicked on the ARC.TTP program from the Desktop and have the parameter dialogue box on your screen.

In many cases, simply typing a '?' or 'h' will provide an extensive list of available options.

Source and binary code for archive programs have also been posted to comp.sources.atari.st and comp.binaries.atari.st. They are available via e-mail through the panarthea archive server. See Steven Grimm's posting for more information on how to obtain files from panarthea.

ERR
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6
Unknown media.....-7

Bad sectors on format.....-16
Insert other disk.....-17
Invalid function number.....-32.....1
File not found.....-33.....2
Path not found.....-34.....3
No handles left.....-35.....4
Access denied.....-36.....5

```
Invalid handle.................-37............6
Insufficient memory............-39............8
Invalid memory block address...-40............9
Invalid drive specified.........-46...........15

No more files..................-49...........18
Range error....................-64...........33
Internal error.................-65...........34
Invalid program load format....-66...........35
```

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

```
Number
Description of bombs

PAINT
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

GDOS
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of
STart, volume 1 number 1 said...)

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and
more)" by Douglas N. Wheeler from the atari.archive server. The file is
/atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server.
The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files
or font files (at least those supplied by Atari). You can get these files
with many commercial programs, such as Degas Elite, WordUp!, etc. You might
also want to check your local user group to see if they received a copy of the
WordFlair demo program (also available on GEnie). The demo program appears to
have the GDOS system and font files.

CLI
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor
BASH GNU Bourne Again Shell - available under MINT
ksh Korn Shell - available under MINT
gemini MUPFEL is the shell used by the gemini environment
okami a German shell with many useful utilities built in
pcommand an MS-DOS-like shell

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

TEX
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.0) has recently been made available on the atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the minimum files needed to get a working TeX/LaTeX system up and running on the Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

LANG
Public Domain/Shareware languages...
==========

Check the atari.archive server under /atari/languages. Currently included:

abc
apl Demo and 'J' j_29.arc,apl68000.arc
forth Don't know which, I prefer BRADLEY FORTH
FORTRAN77 BC-FORTRAN version 'C' bcf.lzh
icon ICON icon2.arc,icon_bin.arc
modula-2 From Germany modula2.zoo
Sozobon C Most excellant
Elan
xlisp
xprolog
xscheme

GNUC
Is GNU C available on the Atari ST?
==========

You can also get the GNU C program, which runs on 1 megabyte Atari ST systems. For more than minor programming, you may need to upgrade to 2 or more megabytes, as the GNU programs generally assume you've got plenty memory.

GNU C for TOS is available via anonymous FTP on atari.archive. It is also available via anonymous FTP on cs.uni-sb.de [134.96.7.254] and most of the other European FTP sites.

How do I set it up once I get it?
==========

I just spent a bit of time putting the gcc compiler on my hard drive. I tested it using the good old reliable 'hello.c' program. Here are the notes I made with regard to installation:

The following files were FTP'd from the atari.archive server:

/atari/gnustuff/tos/gcc139b.lzh

(current file [as of 7 May 91] on atari.archive has a corrupt GCC-CC1.TTP)

/atari/gnustuff/cc1-139.zoo

(good copy of GCC-CC1.TTP)

/atari/mint/mntolb8.zoo
/atari/mint/mntinc8.zoo

(you -might- want to use it with MINT, so why not?)

1. Extract all files EXCEPT 'gcc-cc1.ttp' from GCC139B.LZH (the file is corrupted in the current version on atari.archive). Place the files in \EXEC and set the environmental variable GCCEXEC to point to the directory.

2. Extract 'gcc-cc1.ttp' from CC1-139.ZOO and place the file into \EXEC.

3. Extract all files from MNTOLB8.ZOO. Place the files in \LIB and set the environmental variable GNULIB to point to the directory.

4. Extract all files from MNTINC8.ZOO (including subdirectories!). Place the files in \INCLUDE and set the environmental variable GNUINC to point to the directory.

Add the following aliases to your CLI's autoexec file. The following lines come from a slightly modified 'gnu.g' which came with my release of the Gulam shell. Check your CLI docs for differences in how environmental variables, etc. are set!

gnu.g
```
----- cut here ------
unalias cc
unsetenv TEMP
#
# set up commands for gcc and gas
#
alias cpp d:\exec\gcc-cpp
setenv cpp d:\exec\gcc-cpp.ttp
alias cc1 d:\exec\gcc-cc1
setenv cc1 d:\exec\gcc-cc1.ttp
alias gas d:\exec\gcc-as
setenv gas d:\exec\gcc-as.ttp
alias as d:\exec\gcc-as
setenv as d:\exec\gcc-as.ttp
alias link d:\exec\link
setenv link d:\exec\link.ttp
alias ar d:\exec\gcc-ar
setenv ar d:\exec\gcc-ar.ttp
alias ld d:\exec\gcc-ld
setenv ld d:\exec\gcc-ld.ttp
alias gcc d:\exec\gcc
setenv gcc d:\exec\gcc.ttp
#
```

```
alias cc d:\exec\gcc
setenv cc d:\exec\gcc.ttp
alias xcc d:\exec\gcc -Bd:\exec\x
setenv xcc d:\exec\gcc.ttp -Bd:\exec\x
#
alias make d:\util\xmake.ttp
setenv make d:\util\xmake.ttp
#
# bison...
#
alias bison d:\bison\bison.ttp
setenv bison d:\bison\bison.ttp
setenv BISON_SIMPLE d:\bison\bison.sim
setenv BISON_HAIRY d:\bison\bison.hai
#
#
# nm
#
alias nm d:\util\nm.ttp
#
# Flex
#
alias flex d:\flex\flex.ttp
setenv flex d:\flex\flex.ttp
setenv FLEX_DEF d:\flex\flexdef.skl
setenv FLEX_FAST d:\flex\flexfast.skl
#
# General
#
setenv GNULIB d:\lib
setenv GCCEXEC d:\exec\gcc-
setenv GNUINC d:\include
setenv TEMP g:
------ cut here --------
```

OTHER FILES YOU MIGHT WANT/NEED:

FLEX.ZOO - lexical analyzer
BISON.ZOO -
DOCUMENTATION.ZOO - some nice-to-have documents in TeX format
DIFF115.LZH - can handle binary files as well as ASCII files
RCS5AP1B.LZH and RCS5AP1M.LZH - Revision Control System
GULAM.ARC - one of many CLIs which will work with gcc

Like I said, I successfully compiled a program using the above procedure (and I didn't have bison or flex or the documentation or RCS or diff...) so it is the minimum you need to do to get going.

If anyone has corrections, additions, suggestions about these directions, please send me e-mail so I can incorporate them into the next 'welcome to comp.sys.atari.st' ... I'll be working on minimal TeX / LaTeX instructions

next.

FREE
What is Free-Net and how can I get access?
==========

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor.

Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to myself via the e-mail addresses above or by writing the SIG at its US mail address:
The Atari SIG
P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout the world. We look forward to seeing you all real soon! Remember the staff of the Atari SIG are volunteering their time for no pay and the Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization existing for the free exchange of information.

CIS e-mail : internet>aa338@Cleveland.Freenet.edu

MINIX
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)

- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.

If you want to follow the MINIX discussion, read the comp.os.minix newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

DEV
How do I become a developer for the Atari ST?
==========

Contact Gail Johnson, Atari Rep Person, (408)745-2568

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you desire.

Atari has gone to a 2-tier developer membership. The 'higher quality' developer support goes to commercial developers, and costs $250. The 'no-hand-holding, no announcement of company future products, no access to discounted hardware' goes to noncommercial developers, at an initial cost of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill in an application form and a non-disclosure agreement. Contact Gail for more information.

ZNET
Where can I get copies of ZNET?
==========

ZNET on-line magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

ZNET and some information from the Current Notes user magazine are also
available from the atari.archive server under /atari/magazines.

PALS
ST Pen Pals list
================

Simon Chappell is compiling a list of people interested in exchanging
paper-based mail "of interested parties who could then
keep in touch and prevent themselves losing touch with the ST community
at large (this would be especially easy if someone who still had net
access could summarise current topics or forward news and advice!)"

He is accepting entries in this format:

eg Simon Chappell.
s61304@uk.ac.psw.pa (NOTE: NO LONGER VALID ADDRESS...)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

Contact Simon at his paper mail address if you are interested.

MAGS
What magazines are available for the Atari ST?
==

The information here is preliminary. If you've got updates, mini-reviews,
or more information on other magazines, please send them to me via e-mail.
As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free
[$6.00/50 magazine shipping charge] from participating computer dealers,
bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class (there is
currently a $15.00 introductory subscription available for a limited time).

Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may
subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year)
Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine
(Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

Subscription costs: UK - 15 pounds; Europe - 18 pounds (Air Mail); worldwide - 28 pounds (Air Mail)

Address: ST Club, 49 Stoney Street, Nottingham, NG1 1LX ENGLAND

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90. Now, allegedly, about to be revived as a monthly (under the stewardship of Jean Gollner, mother of ex-editor Hugh) in the wake of Atari UK's new push into the 'serious' market.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people. Lively, but of uneven quality. Big leisure section, but other areas covered too. Includes cover disk - mix of games demos and (usually out of date) PD utilities. Probably the biggest-selling UK ST mag. Has had several public rows with Atari UK.

Atari ST User:
---

like ST Format. Generally (amongst online users) thought to be not quite as good.

ST Action:
---

games, games and more games. And games.

There are ST sections in New Computer Express (weekly), Computer Shopper (monthly) and some general-purpose games mags whose names I forget.

There are also, I think, some MIDI mags with strong ST content. I don't have their names.

German Mags:

Atari PD Journal:

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this information, DP-Z]. Hardware and Software reviews, some commercial software reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100 Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Markt & Technik Verlag AG, Hans-Pinsel-Strasse 2, D-8013 Haar bei Muenchen GERMANY

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

BOOKS
What books are available for the Atari ST?

TIPS
TIPS AND HINTS from other users
==============================

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to drive B. Handy when a program 'hard-codes' the data drive, and you wish to use your hard drive instead. (It is available on the atari.archive server.)

There are no problems in using 2.5 megs on a STFM, also use SIMMS.
There is a file at atari archive 2_5ram.zoo, on how to do this, this is
by far the better method.

You don't need fast rams or simms 150ns or faster, have a look in
the UK Computer Shopper for simm prices, from what I remember about 30 pounds
for a one meg simms.]

I have just upgraded my STFM1040 to 2.5 Megs , but using simm sockets,
mounted on vero board, I had to remove the first bank of ram, but I
did provide the option to go to 4 megs..

The normal way to do it, is to just stick the simm cards down with
double sided tape, plus some wiring and also removing a bank of ram..

502. In search of "MindLink"

Newsgroup: comp.sys.atari.st
Date: 1991-06-17 17:29:45 UTC
From: sean@think.com
Message-ID: <1991Jun17.172945.20889@Think.COM>
Source record: 231124
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Around 1984, a friend of mine forwarded me a clip he had seen in Popular Science regarding a new Atari product called "MindLink" that purported to allow you to control your computer with your mind (read: play video games):

> Quoted from the September issue of Popular Science, an excerpt
> from an article about the latest Consumer Electronic Show
> in Chicago:
>
> '...Atari's "Mindlink" is a band that goes around your head
> and connects with the company's new 7800 video game. Result:
> no joy stick. Just THINK about where your player should be
> on the screen, and it goes there (eventually). It takes
> practice...'

Presumably this is just a piece of hardware that monitors alpha-waves and you have to train to use it via biofeedback. Does anyone out there know if this product ever really made it to market? Does anyone out there *HAVE* one of these (that they'd be willing to sell)?

Sorry, GUIs to dis-a-point you, but there is no future at all.
Even in the biggest market (Germany) the software houses jump over
to a faster train PC and Windows (see Borland, Technobox, etc.)...
TT is not as powerful as IIfx or 486 (don't even think about
NeXT)! Since 1985 ST & Amiga 'a fight between losers' (to be
continued).
Innovation and high tech is made by Bill Gates, Steve Jobs
and others but not in Borregas Avenue...
The old GDOS had only few driver...
The new FSM-GDOS has not yet been released...
...but Adobe's Type Manager, Bitstream, True Type, etc.
enjoy already the best critics as bestsellers in competitors'

computer business community.

It is really frustrating to support a TOS-based system for
five year and to observe a very very slow progress (or degress?)...

likos@clinet.fi

506. Language translation for Atari ST

Newsgroup: comp.sys.atari.st
Date: 1991-06-17 19:20:43 UTC
From: lunnon@qut.edu.au
Message-ID: <1991Jun17.142043.30548@qut.edu.au>
Source record: 231113

I am just completing the last steps to a beta test version of a program
to translate documents between languages. This arose because of the
now common rash of german language texts. The program at this stage
does only literal translations , acting as a mega search and replace
tool. At this time the features are:

Single word translation to multiple word output.
Limited Gem interface.
Extendable dictionary.
multiple target word support
simple dictionary format.
works with mint and overscan

Problems are:

Brain-dead dictionary handling.
Strips punctuation completely.
No pre-built dictionary (Though you can build it as you go)
Needs LOTS of MEMORY (I think I will start writing for FSF after this :-)

I am just trying to sort out a problem with adding dictionary entries, the
program keeps an ordered dictionary but under some conditions new entries are
added in the wrong place, I suspect this is due to a signed-unsigned problem
in the searching routines.

I have translated some simple texts and to say that the process of literal
translation between German and English is inappropriate is an understatement
this program generates ALMOST unreadable english, but this is using a
dictionary created by a non german speaker.

CALL FOR DICTIONARY BUILDERS/BETA TESTERS:

I would like a number of Bi-Lingual volunteers to generate dictionaries
for me and to provide advice on additional features required to make this
useful. I have found that sitting with an english-german dictionary
generates ghastly output especially if you don't know german.
Translat will probably work best with multiple dictionaries tailored to the
type of texts. First type I would like to deal with is computer related
documentation ;-). In the process I expect we will get a couple of useful
documents translated

INITIAL POSTING

Upon completion I will also post the Beta Test version to atari.archive, this
will not contain a useful dictionary but you can build you own while you are
translating the documents. (But I still want some formal beta testers)

Conceivably, it could be much more mundane; the band could simply monitor tension on the forehead muscles rather than detecting alpha waves. I believe the product "Relax!" by Synapse many, many years ago used a head band that monitored tension as a biofeedback device, with which you could "control" a kaleidoscope display. I never saw the device myself, I just read about it.

I agree. Great game, and the price is right! As for it being easy,
try playing it with two sticks and no droid. It is easy until about
level 30.

Out of curiousity, which is the samantha fox sample? What does one
have to shoot to invoke it?

Well, I can vouch that such devices used to exist. I remember playing
with one on my old Atari 800 (8-bit). I cannot remember the name of
the software, but it included a "band" type sensor. The program had
three parts. One was a sophisticated biofeedback monitor, one was
a really neat graphic/sound demo which was supposed to help you "relax",
and finally there was a (very mellow) game. The game had you guide a
balloon up through the sky, avoiding mean old clouds and stuff. As a
controller, the thing basically emulated a paddle (ie left and right).
To get the 9 signals needed for a joystick would take some doing?!?!

510. Lattice C Assembly

Newsgroup: comp.sys.atari.st
Date: 1991-06-17 20:45:15 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1991Jun17.204515.11396@lsuc.on.ca>
Source record: 231137

I've just run into my first problem with Lattice C. The
manual is not sufficiently detailed regarding the requirements
for assembly language for using ASM. I tried using OMD to
disassemble a ".O" file and found that my copy of OMD crashes.
As such, I'm stuck for now. I'm going to be ordering an update
later this week but that'll take about 3-4 weeks (across the US-
Canada border this is about the fastest you can count on).
If has a working OMD for Lattice 5.06, I'd appreciate it if
you could compiler the following test code down to a ".O" file
and then send me, or post a disassembly of it so I can see
the packaging that ASM and CLINK require:

```
/* Test.C */

int
test(arg1,arg2,arg3,arg4)
int arg1;
long arg2;
int arg3;
int arg4;
{
arg1 = arg1;
arg2 = arg2;
arg3 = arg3;
arg4 = arg4;
return 0;
}

/* End of Test.C */
```

>15 gray scale levels on a regular ST (normally only 8 levels are possible.)

interesting...

i posted to c.{s,b}.a.st about 2+ weeks ago a new version of mgif which now does flicker, too. only now mgif does more than just display. you can do histo equalization, contrast stretching, inversion, thresholding, convolutions of all sorts, median filtering, blurring, and a raft of other image processing. i have a new version ready to go (posted 3.2, current is 3.5) which also saves the flicker screens (i use 3) to a file which is smaller than gif and can be viewed by mgif, too. new version also reads PI2 and PI1 files. maybe i should upload to a.a instead of the "normal" channels of the binaries/source groups? incidently, as always, i post complete source. mgif works with all GIF files (GIF87a, that is). it is still slow, but can be made to go faster. i opted for modularity over speed. mgif only runs on mono systems. the binary posted needs 1.5MB memory or so. there are easy hooks to support spectrum and other formats. just read the file into a raster and colormap (RGB). flicker is tons better than just dithering. you'd be suprised just how good an image can look. the flicker is virtually unnoticable, too. no more standing 10 feet away or squinting!

john, i'd be interested in your technique. mgif does flicker by passing a ptr to a grayscale image to the screen drawing routine which then returns a ptr to the (sequential) flicker screens. it is very modular. i am going to have a look at yours. i assume it works on mono...

-bill
rosenkra@convex.com

(it really only works on gifs up to 400,000 pixels without a recompile. that is 640x600+, however)

From article <PNH.91Jun17135441@pmin24.osf.org>, by pnh@pmin24.osf.org (Peter Harbo):
> I would like to transmit data between my Macintosh SE and Atari 520 ST
> using a cable between their serial ports and kermit or zmodem. Does anyone
> know where I can get a cable for this purpose?
>
> Peter Harbo

The cable for ImageWriter I printer is probably the easiest to find
answer for you. Some of us Magic Sac (remember that?) users had to
use such a cable to transfer Mac software to the ST. Otherwise it
is also sold as a "null modem" cable.

517. gcc 1.40

Newsgroup: comp.sys.atari.st
Date: 1991-06-18 08:15:00 UTC
From: dpg@cs.nott.ac.uk
Message-ID: <1991Jun18.081500.851@cs.nott.ac.uk>
Source record: 231139

After all the recent discussion about the forthcoming release of gcc 1.40
on the ST, I'd like to make an appeal to those who are actually doing the
work: please, please, please make sure that it does NOT mangle filenames
like versions up to 1.39 did. My biggest gripe with gcc is that it doesn't
work happily on a Minix partition under MiNT; I know that there are other
people who also use this type of setup who I'm sure would appreciate a
'clean' version. Perhaps it would be enough to use Eric Smith's MiNT
library; I'm not familiar with the changes made to port the compiler to the ST.

I am immensly grateful to those who have ported gcc; it's a superb compiler
and I don't know how I'd get by without it. :-)

Several different 'detex' programs exist, if you don't wan't to go through the trouble of setting up TeX/LaTeX.

I have one for emacs (called detex.el) that I can mail to anyone interested. It should also be avaible on major emacs-lisp ftp-sites. I haven't tried it though, so I don't know how good it is. One probably looses a lot of structure (chapters, sections, headings and such) in the process, I guess.

519. MV16 sound cartridge.

Newsgroup: comp.sys.atari.st
Date: 1991-06-18 10:20:10 UTC
From: adm2@doc.ic.ac.uk
Message-ID: <1991Jun18.102010.19752@doc.ic.ac.uk>
Source record: 231054
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech
Body handling: HTML body converted to readable text

Hi,

Well about a month ago,I posted a request for information about using the MV16 sound cartridge,what comes with BAT,for playing samples.I receive little response,unfortunately apart from Dave Lockwood .So I imagine,that not many people out there know how to use it,so after some work ,I have finally worked out how to use it .

So what follows is a describtion of how to play samples through the MV16 sound cartridge,which gives 16-channels of mono 8-bit sound!

The first thing that must be understood is that,because the MV16 plugs into the cartridge port then it is not possible to write data directly to it along the data bus.This is due to the MMU or GLUE,which has this area $FA0000 to $FBFFFF marked as read-only.So what is needed is to find the way in which the volume and channel data is passed to the cartridge.

Now as Dave,rightly pointed out,this is simply done by using the address lines. So to send some data to the cartridge port,you simply place the data as the lower 1->15 bits of an address in the range $FA0000 to $FBFFFF and then when you read this address,those lines are setup correctly.

NOTE:- That the cartridge port is Word addressed and so even though the address may be described as bits 0->23,the zero bit is not used in the cartridge port ,so that even addresses are always used! And the higher bit`s describe the cartridge port area of 128k at $FA0000.So this gives us the bits 1->15 thru the cartridge port.

Now all that was needed was to work out which of the bits 1->15 did what,with a MV16 plugged in.To do this,I sat down with my trustly electronics/computer reference books,a ST and a disassembled MV16 and se about some reverse engineering!

And this is what I found.Firstly bits 1->4 ,of the address,denote what channel to use.And secondly the bits 5->12,of the address,denote the volume data to play on that channel.So an addresses bit pattern looks like this:

```
Bit 1 1 1 1 1 1 0 0 0 0 0 0 0 0 0 0
5 4 3 2 1 0 9 8 7 6 5 4 3 2 1 0

$FA # # # D D D D D D D D C C C C #

| | | | | | | |
Higher < N/A > < volume data 8-bits > < channel> Not used
Bits
```

Give
$FA

So to play the data 10101010 on channel 16 (1111) then you only need to use:

MOVE $FA155E,R0 where $FA155E is the hex (111110100001010101011110)
| | | || |
< $FA >

And it`s as easy as that...

So if you`re thinking of producing some sort of sample playing program,
either commercial or PD,please include support for the MV16 sound cartridge!!!

NOTE:- To test if the cartridge is present,play a note of zero volume and if you
can a none zero value back then it's there,I think...

NOTE:- These are only provisional outcomings and are not guaranteed to be
perhaps after the summer,if there are any correction needed then a newer
version will be published... If you wish to upload load this to a archive
or BBs please feel free.

522. MEGA STE problems solution

Newsgroup: comp.sys.atari.st
Date: 1991-06-18 12:39:13 UTC
From: larserio@IFI.UIO.NO
Message-ID: <CMM.0.90.2.677248753.larserio@kvart.ifi.uio.no>
Source record: 231056

The last weeks several people having the same trouble with their
new MEGA STE has asked me how we fixed mine, and I hope this file
can help you fix it. It's really the best machine Atari has made
so it would be terrible not to have it in perfect condition :-)

Errors on DMA-sound and video on MEGA STE - HOW WE FIXED IT !
"""

Here's a summary of what we found at service in Norway.
First - the errors on both machines we discovered were:

- Static/noise on DMA sound and MIXed standard ST sound.
- Sync-problems when using Spectrum512 pictures (vertical bars).
- Vertical flickering bars on monochrome (most at 8 MHz).
- Right edge of monochrome screen "flips" over to left edge
when changing screen adress/resolution in mono-mode.

We tried to find a chip that could be the cause of all these
problems and found a big VLSI chip partly hidden under the right
edge of the VME-card holder. It's chip U502 on my MEGA STE and
is called GSTSHIFTER on the print-layout. After looking at the
print-layout on both MEGA STE and standard STE we found the same
chip on standard STE, a combined sound/video chip but with a totally
different part-number. Anyway, we removed the original MEGA STE
chip (made in 1990) and replaced in with the STE chip (from 1989)
and all the problems were gone. If you want to "steal" a chip from
a standard STE it's chip U401 inside the STE (still GSTSHIFTER).

Disclaimer: Even though this solved the problems for us it might not
work for all MEGA STE's and you do this at your own risk

(I still would like Atari Corp to give some official information on
this. It's not "ONLY YOUR MACHINE" anymore. It's quite a few...)

From: miskinis@aidev.enet.dec.com
Message-ID: <5310@ryn.mro4.dec.com>
Source record: 231068

Hello,

A friend of a friend has a ICD Multi I/O for sale. It seems
to take input from a 50 pin connector (output from a host
adapter maybe?), and offers several I/O ports, including
one labeled video!

ANYWAY, he thinks it was used on a ST, but someone else that
I described this to, says it's used with the 8 bit systems.

He want to sell it, but I don't know if I can use it or
not...

Does anyone out there have any information on this beast?

ANY/ALL help/info is mucho appreciado!

John

525. Is musedt.lzh corrupted?

Source record: 231065

I wouldn't bother to upload the uni-sb stuff to A.A. There has been some divergence of philosophy between a.a. and uni-db.de (UNIXMODE mainly). I had most of this code (cat as well) and eventually deleted it in favour of currently-supported GNU s/w.

The code at uni-sb.de is mostly binaries with very little sources, due the porter's lack of immediate access to the uni-sb machine. This is one of the reasons I wanted to put together a complete and up-to-date GNU suite on A.A.

Yes, uni-sb.de Make will probably want UNIXMODE setting. It is also possible that you might have to remove the file extensions from your executables, Edgar Roeder pursued bash for a while and it stems from this.

Why don't you try jrb's pdmake? One day real soon now I'll post the make 3.58 which I have been using without problems under Mint v7 (anyone else found Mint v8 to be somewhat flaky?) to compile the GCC 1.40 libraries and utilities on my 4080STFM.

527. What to do with antique STs?

Newsgroup: comp.sys.atari.st
Date: 1991-06-18 15:53:48 UTC
From: exspes@gdr.bath.ac.uk
Message-ID: <1991Jun18.155348.4897@gdr.bath.ac.uk>
Source record: 231099
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Well, no one seems to have any hi-tech project ideas for my ancient
ST520, but I got a (hopeful) lateral-thinking piece of mail from
someone in Virginia, as follows:

> From: lch3e@edu.Virginia.acc.holmes (Lauren C. Howard)
>
> Hi! You can always donate the poor thing to our school!
> The Einstein School is a small private school where I teach
> computers to children with dyslexia and other learning problems.
>
> We use lots of Atari's, tho we have only 1 ST to date (needless
> to say, it's the most popular machine!). We can always use more!
> For our purposes, they work pretty well with a TV set.

As I told Lauren, I don't think my ST would meet their needs, not least
because it uses 50Hz 240v electricity, and outputs 25 frame/sec
625-line RGB, and contains neither modulator nor disk drive, but the
overall concept is sound.

If you've got an old ST (or other home computer) lying around, you
probably could find some such (semi-)charitable organization near you
who could make very good use of it. Might be worth thinking about.
(If you're in the US, you should even be able to claim a tax deduction
for it.)

TOS14FIX.PRG fixes the RTS/CTS problem with TOS 1.4
I don't believe earlier versions of TOS had this problem.
Quote from TOS14FIX.PRG docs follows:

"1) A change was made to the BIOS call that sets the RS-232 port
configuration. Specifically, it did not allow RTS/CTS flow control to
be enabled. This is a problem for people with serial printers and high
speed modems, since those devices use RTS/CTS flow control to start and
stop data transmission so that the device can keep up with the
computer. If you have Rainbow TOS, and you use a high-speed serial
device which requires RTS/CTS flow control, you need this program in
your auto folder."

532. 24bit -> spectrum (my solution)

Newsgroup: comp.sys.atari.st
Date: 1991-06-18 17:42:23 UTC
From: dkoski@cs.arizona.edu
Message-ID: <1579@caslon.cs.arizona.edu>
Source record: 231064

Thanks to everyone who replied to my query about converting to
spectrum format. The route I ended up taking was converting my
24 bit image to an 8 bit gif file and then converting that using bgif.

The down side of this is the time required. I am doing raytracing on
my Next and this usually takes 20 seconds to 2 minutes (for a 320x200
fractal landscape image). I can convert the resulting 24 bit image to
gif in under a second, but it takes bgif quite a while (I didn't time
it, but I would guess 2 minutes or more) to convert to spectrum. I
then use dslide to view the pictures. I have gotten really excellent
looking results. I can view the pictures on my Next, but only in shades
of gray, it is nice to see them in color too.

Oh yeah, the raytracer on the Next is Rayshade 4.0, and I use the
Utah Raster Tooolkit to do the image conversions for the ST.

```
BRANDNAME: Atari
MODEL : SX212
SPECS : 300/1200 baud, auto answer, hayes compat., speaker, etc. etc.!
CONDITION: LESS THAN ONE MONTH OLD
Y SELLING: GOT a 2400 baud w/mnp5, no longer need 1200 baud.
COMESWITH: Original packing materials (instruction manual, box, power supply
...)
PRICE : Make me an offer! I just want to get SOMETHING outta this.
MISC : This is an external modem which will work with *any computer*
which sports an RS-232 port. Can also be hooked up to a serial
port if you are into kinky connections. :)
CONTACT : Bryan_Jones_Woodworth@cup.portal.com

Thanks,
Bryan_Jones_Woodworth@cup.portal.com

>have to shoot to invoke it?

Knowing how hot and horny Samfox is, I think it has to do with the
"I love you" digitized effect. What you do is grab the heart; then the
sample is played and every camel/llama onscreen runs toward you!

Llamatron is a GREAT game.

> ^^^^^^^^^ ^^^^^^^^^^^^^^

To clarify, to install a program as the auto-exec GEM program in TOS 1.4
and newer, you click on the program, then click "Install Application" and
select "Auto" for the "Boot Status." Then Save Desktop to save this
selection to disk. Next time you boot, the program thus installed will run
after GEM is up but before you see the Desktop. If it's a shell, then
you'll never see the Desktop, which I guess is what some people want.

These kinds of documentation are available to developers through the Atari.
Call Gail Johnson at (408) 745-2022 for information on becoming a
developer.

>My version of Mint (0.6) does not seem to work with the TT is there a version
> that does ?

The latest one, 0.8, does. However, there are some problems in exception
handling. 0.7 worked better, but I don't know if the released version of
0.7 had the TT modifications.

>Is there a switch for gcc (my version is 1.39) to use 68030 code, to use the
> co-processor and the full TT memory ?

Yes, use -m68020 and -m68881 on the GCC command line, and use PRGFLAGS.PRG
(freely copyable, available on GEnie at least) to set the program-load and
malloc bits so your program can see all TT memory.

>I tried to connect my external 5 1/4'' floppy i used with the st to the tt
> but failed. any ideas why ? (i just pulled the plug out of the st
> and into the tt, but the tt couldn't handle it. :( )

Don't know why. Should have worked. Do you use a hack program to change
the seek rate, or a program that makes the Floprate() XBIOS call? In the
former case the program is probably TOS-version-specific, and in the latter
case it should work.

538. ST System For Sale

Newsgroup: comp.sys.atari.st
Date: 1991-06-18 22:09:22 UTC
From: bobw@hpsad.HP.COM
Message-ID: <750119@hpsad.HP.COM>
Source record: 231077

I'm willing to sell my (old but little used) system given a reasonable
offer.

System Hardware:
520ST w/JRI SIMM memory expansion (2.5M installed)
Atari single sided drive
Atari color monitor
ICD Host Adaptor/Adaptec 5500 with 10M and 40M discs
(installed in box manufactured by Tech Specialties)

Software:
WordPerfect (latest release)
Mark Williams C
Quick ST 2.2
DC Desktop
Universal Item Selector III
Pha$er
DungeonMaster/Chaos Strikes Back
TeX (from Current Notes)
Turbo Hard Drive Kit
Hippo Disk Utilities
(lots of other stuff, most public domain, I can't remember
right now)

As much fun as I think the Atari is, my partner and I really need
something IBM compatible. I need a good HP terminal emulator to call
work with, something to dependably run my diabetes maintenance
software and (for her) run the latest WP just like at her work (I like
TeX).

All offers considered.

540. handling serial io in turbo-c

Newsgroup: comp.sys.atari.st
Date: 1991-06-18 22:37:00 UTC
From: msoysal@mcimail.com
Message-ID: <00000000.msoysal@mcimail.com>
Source record: 231070
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi, I have a problem accesing the serial port with the fgets and fscanf functions.

If I use "aux:" for filename and "r+" option for permissions, I read garbled characters into the buffer, and sometimes it sits there and probably waits for input from serial port, while the data is pouring in.

If I use the predefined stream stdaux, I get a bus error with one of the tries to get something with fgets.

Has anyone done any work with the serial work using Turbo-C ?

Please help

Source record: 231003

here he goes again...

as an (outspoken?) opponent of lharc (until it gets it sh*t together),
i read with interest a previous post about testing at least a dozen
(!!!!!!!) versions of lharc on a particularly nasty file. since at least
one of them (2, i think) worked, the file COULD be considered "good"
(not by ME or any other sane, rational user, however).

then i came across this gem:

In article <1991Jun18.151348.795@ccu.umanitoba.ca> bright@ccu.umanitoba.ca (Bob Bright)
writes:
>(To all the progenitors of lharc and .lzh files: I hope you die a
>thousand miserable deaths, choking forever on the few megs of disk
>space you've managed to save the world at the expense of countless
>hours of frustration and wasted time and net bandwidth.)

i LOVE this guy. he hits the point home! "a pox on you [lharc-ers] and
all your ancesters" as ed norton would say :-).

and NO, as much as i would REALLY like to, i will NOT eat my words (yet :-)

so you STILL think i am nuts? (rhetorical: don't answer that... :-)

-bill
rosenkra@convex.com

(incidently, i will try to ftp mgif v3.5 to terminator tonite if i can.
it takes steve tons of time to post. i will post to c.{s,b}.a.st as well.)

546. SW for trade in Gainesville, FL

Newsgroup: comp.sys.atari.st
Date: 1991-06-19 02:35:46 UTC
From: daremo@alpha.eng.ufl.edu
Message-ID: <1991Jun19.023546.5542@eng.ufl.edu>
Source record: 231069

ATTENTION GAINESVILLE ATARIANS!

I have recently purchased an ST, and am interested in trading some of the programs I don't want (originals with docs) for some of the things I do want. I am also willing to trade for MIDI equipment, if you have anything interesting. If you are interested, please call me at the following number (_voice only_)- 377-8308.

programs I want: (originals w/ docs)
wordperfect
notator (midi program)

hardware that interests me:
MIDI equipment (esp. a master keyboard)
a hard drive
a clock chip
1 meg expander chips (I have a 520, expanded to 1 meg)

If you have anything else of interest, let me know!

Things I have to offer/trade:
Targhan
Goldrunner
Eightball
Warship
Starflight
Dungeon Master
Chaos Strikes Back
Falcon
Time Bandit
Flight Simulator II
Spitfire 40
Sundog
Empire
Captain Blood
Gunship
Universal Military Simulator

I will, of course, modify the number of programs I'm willing to trade based on what you have and which programs you want. I will also consider _small_ monetary settlements depending on the situation.

P.S.! if you reply by E-mail I might not see it for a week or more, so use the voice line!!!

Thanks,
Keith

P.P.S.- I'd even be willing to trade my piano for a good master keyboard- but only because I'm moving and one is a lot easier to move than the other...

547. 1040ST for $350?

Newsgroup: comp.sys.atari.st
Date: 1991-06-19 07:03:24 UTC
From: MRC@CAC.Washington.EDU
Message-ID: <1991Jun19.070324.24445@milton.u.washington.edu>
Source record: 231073

I have the opportunity to get a used Atari 1040ST for $350 -- monitor, computer, mouse, single floppy drive. I'm trying to decide if this is a worthwhile purchase or not. Part of the trouble is whether or not it can be put to use as a useful computing engine or, if it is is just a toy, is it at least viable as a toy. [Note: I have a NeXT, so where I draw the line between "toy" and "engine" may be different from you.]

Specific questions (reflecting several possible uses):

Is Atari still in business and making the 1040ST?
Is it a 68000 or does it have something better (e.g. 68020)? Clock speed?
Is there an Ethernet interface (preferably thinwire) and TCP/IP software for it?
What software is bundled with it?
What software is generally available?
Is anyone doing software development for it any more?
Is the available software real, or is it a just glorified game machine the way the 8-bit Atari was?
What's the scoop on the Macintosh emulator, in particular how would a $450 1040ST plus the emulator compare to a Mac Classic for $800?
What sort of educational software for it exists to teach children programming, e.g. is there a reasonable Logo? Has anyone had any experience using it as an educational tool for their children?

Finally:
Is $350 a reasonable price for a floppy-based 1040ST?

Email please to the above address, since I don't read this newsgroup.

548. mgif v3.5 ftp'd to atari.arch

Newsgroup: comp.sys.atari.st
Date: 1991-06-19 07:05:20 UTC
From: rosenkra@convex.com
Message-ID: <1991Jun19.070520.10506@convex.com>
Source record: 231074

several folks sent mail, so rather than wait for it to appear on the
net, i ftp'd it to a.a. only i am not sure how to notify the maintainer
(i know, RTFM) so consider this the notification as well. i did basically

cd new
binary
mput mgif35*.arc (no LZH for me, thanx :-)

files are mgif35s.arc (source, about 100k) and mgif35b.arc (bin, about 75k).
anyway, if this worked, it should be avail in a day or 2.

mgif is a gif viewer for monochrome. this version also does flicker mode
displays for like 8+ levels of grayscale. i say 8+ because the images
in each screen are also F-S dithered, so it "looks" like more. anyway,
i think images look good. i'd rather program useful stuff than dick
around with lharc formats anyday :-) (sublim advert).

this version also adds tons of imag proc funtions, too. u can save the
flicker screens and view them. u can also view .PI1 and .PI2 images. src
has relatively easy hooks for other formats (like spectrum). ONLY WORKS
FOR MONOCHROME. you also will need 1.5 MB of free ram for the executable
posted. else recompile yerself (src is there, too). sorry, i don't trust
Malloc so i static alloc big stuff like this.

and most importantly, it is in good 'ol american .ARC format, so ANYBODY
should be able to read it :-). well, u will need arc 5.21 or later, which
has been around for at least 3-4 years. sorry. and no flames on this, i
have smileys in key places, like now: :-)...

[LHarc test results deleted.]

|> I hope that these results might be of use to all.

Oh yes, it is. They clearly show at least two facts:

1. You have to fiddle around to get a proper LHarc version.

2. If you pack something with (your version of) LHarc you can't be sure the fellow at the receiving end will be able to unpack it, because he might not have an edequate LHarc.

Your test still leaves open the question if the tested LHarcs are compatible to one or more Unix LHarcs.

I use xlharc that was posted to USENET. It works *very* well, since I test all the archives before bringing them to my Mega 4 ST. I then retest them on my Atari to be sure that all is fine. Its reference is the following:

C-LHarc for
Usage: %s {axevlufdmctp}[qnftv] archive_file [files or directories...]
Version 1.00 (C) 1989-1990 Y.Tagawa, Kai Uwe Rommel

The original Unix lharc had problems for uncompressed file members, a common problem for many of the ST lharc versions that abound. Someone locally patched the initial Unix lharc. Its reference is:

C-LHarc for UNIX Version 1.00 (C) 1989-1990 Y.Tagawa, Kai Uwe Rommel

Unfortunately, they are virtually indistinguishable. Xlharc was posted to the net by B. Davidsen.

Hope that this helps further.

Hi,
I'm very sorry I don't have the time to translate all this into English.
Anybody else who tried please let me know!!!
The `help' file should give you some hints about available commands and
options.
The next version (1.3 to be released soon) will come with brief English
instructions explaining at least the principal commands and flags.

For all other problems, I'll be glad to help. If you need information
about commands, flags and so on, please contact me on
Wolfram_Roesler@ac2.maus.de
from where I will respond quickly.

(Btw, now that we're talking about it: 1.3 will come with up to 2000%
speed increase for cp and helpfile loading, some new commands and an
MSDOS compatible format.ttp. Keep looking...)

DC Desktop has the ability to place folders on the desktop, so I guess they've already addressed your problem.

In a similar vein, I came across a program posted to GENIE last week called LOGDRIVE -- it basically let's you set a folder on your hard drive as a logical drive. I haven't used it yet (too many other things to do last week...), but I can see about posting it to the atari.archive site if it isn't already there. I don't remember if the program is shareware or no...

Areyou sure about this figure? That seems like quite a bit. The people
at DC write excellent programs. If they're listening now, though, I
wonder if they will ever write a program that allows you to change paths
on your hard drive from a "tree"? This would be a good program, since
GEM is such a pain to use when you want to go several layers deep. With
a few default paths, this could be a really nice program. The ohter
programs I have seen from them (DC Topper most recently) are quite
impressive.

Lars: could you release an autofolder prog that does only the ALT-ascii
number feature as described above. I've just got a normal 1040 st and
i'm not sure what the other features of your program would do (ie: i cannot
change the clock speed - would it crash the 1040ST??)
the other feature is present on PC's and is something i wish the ST ALWAYS
had in it's roms!

559. File format for Microsoft Write

Newsgroup: comp.sys.atari.st
Date: 1991-06-19 13:52:04 UTC
From: podacc@rigel1.concordia.ca
Message-ID: <527@daily-planet.concordia.ca>
Source record: 231086
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I would greatly appreciate it if someone could tell me where I can find
the file format for Microsoft Write for the Atari ST. Also, can someone
tell me if there is a bug with Microsoft Write's print Metafile option?
(I have a utility to convert a Metafile to postscript, but I always get
a metafile corruption error. Unfortunately, I do not know whether it is
a problem with the utility or Write and I do not have another application
that generates metafiles!).
Thank you in advance.

I'm trying to format the largest Spectre format MFS disk possible
(so that I can do some transverting), preferably something like an 800K
Spectre MFS disk. DC Formatter seems to have the buttons for this, but
none of the disks I've formatted with that fine program seem to work.
Could someone e-mail me the correct settings (# tracks, step rate, etc.),
if you've gotten it to work?

Well, I wouldn't exactly say that, but I agree that all the
incompatible versions are bad enough that I won't support LHARC
for the time being either. In retrospect, the law suit against
Phil Katz by the originator or "ARC" was right too. Katz was on
the same road to messing up the .arc file standard that these
guys are on with .lzh files. The only things I use by choice now
are ARC 6.02 and Zoo. At least I know with some certainty that
anyone on almost any computer in the world will be able to unpack
these and with a minimum of frustration due to "incompatible versions."

Take a peek in the DC directory on atari.archive. I don't know about 26
this year, but there has been lots of really neat stuff released recently.

By the way, before I got Neodesk I used to use DCshowit (and loved it).
Unfortunetely you cannot use it from within Neodesk. Any chance of a
stand alone .ttp version for us Neodesk folks?

Over the last few years I have been able to enjoy
the Megamax version of asteroids on my ST.

There is a menu option which offers you the source
code for $25.

Has anyone sent away for this? Is it still available?
Is Megamax still in business? If not, does anyone know
where I can get a copy of the source?

thanks in advance

568. The demo of 15 gray levels

Newsgroup: comp.sys.atari.st
Date: 1991-06-19 19:52:33 UTC
From: logajan@ns.network.com
Message-ID: <1991Jun19.195233.20589@ns.network.com>
Source record: 231037

That demo I sent out which displayed 15 gray levels on an ST was intended for COLOR systems. Though there are 16 color registers on a color system there are only three bits per color meaning you can only get eight shades of gray (except, of course STe's.)

I've received a number of complaints that it fails to work, but only one person who has complained has mentioned whether he was using a mono or color system.

The reason I didn't post the code was that the data portion, which is RLE encoded, is huge in its ASCII hex representation, well over 150k.

The only other potential problem I am aware of is how I allocate memory for the second virtual screen. I don't. I just assume I own 32k of memory after the end of the program.

I'm looking at a Spectre GCR system, which apparently reads Mac disks straight away, and wondering: if I buy such a thing, is there an easy way to transfer files from ST disks to Mac disks and vice versa? It seems that if both formats can be accessed this should be no big deal. Is such a copy utility included/available?

Anyone?

572. Clock for ST; ST vs STE, and other questions

Newsgroup: comp.sys.atari.st
Date: 1991-06-19 22:38:35 UTC
From: Azog-Thoth@cup.portal.com
Message-ID: <43478@cup.portal.com>
Source record: 231088

Well, Ive got a load of questions. I hope I can keep my attention centered long enough to post them...

1. Is there a clock available for the ST? Ive a 520ST and I kinda find if annoying that I have to reset the clock each time I want to use my computer. Is there a device I can build or buy thatll battery back the clock?

2. Whats the difference between various ST models. Such as the ST vs STE. I know the E means Enhanced or something. I am wondering if its possible to modify my 520STFM to be an STE? Also, in a coupla months, I plan to upgrade my RAM, either 2mb or 4mb, and also want to know whats the difference between an upgraded 520ST, to say a Mega-2 or -4?

3. Anyone have TOS 1.4 they wanna sell? :-) Ive the 6 chip version 1.0, and want to upgrade. Im sure that someone must have upgraded their 1.4 machine to a higher rev, and now has the 1.4 chipset just laying around.

4. Finally. CPU accelarators? I see in a mag or two that one company makes a 16MHz 68000 thats pretty simple to install. Is there any other CPU replacements, like an 020 or an 030? (dont tell me get a TT, I never buy computers new :-) I know that these must exist, but am looking for opinions on the 'best' (cost effective and also installation, and how good it is in speeding up the processor)

Thanx!

This is quite silly when you think about it. Why would you Install an
application as Auto start and then NOT save the desktop. I am suprised
that this isn't done automatically (or at least by default). I am also
confused as to why the disk is accessed (considerably) when you install
a program file as auto-start.

Warwick.

575. One program, one week, for one year!

Newsgroup: comp.sys.atari.st
Date: 1991-06-20 00:35:20 UTC
From: uace0@menudo.uh.edu
Message-ID: <1991Jun20.003520.17303@menudo.uh.edu>
Source record: 231008

OK, let's settle this once and for all. Here is our commitment:

We at Double Click Software will write one (1) FREEWARE program per week for one (1) year.

Officially, we announced our intentions to the known universe in February, however, we were already doing this from October 1990. To date, we have well over 26 programs released.

If you are on GEnie, you can do a search on the name DOUBLE-CLICK and find out for sure that we did start back in October 1990. On Compuserve, just go to Atarivendors area 13 and do a DIR on our library (13) and you will see nearly four (4) pages of programs.

When we call it quits, is up to us (hee hee). Officially, we have it marked down on our calendar already. However, no one knows whether we could stop 'cold turkey.' <grin>

So, yes, we are regularly releasing a program each week to:

GEnie
Compuserve
the Double Click Software BBS
and the InterNET (altho the moderator is _extremely_ slooooooow!!! at releasing)

I know that they haven't been released on the internet regularly (we just sent all of them to him about 6 weeks ago, and have been sending him one a week since then) from the moderator.

So... We will have nothing to do with 'nay-sayers,' because we are doing it, and have been for almost nine months already. <nyah nyah> :-)

Any other questions? :-)

>computer. Is there a device I can build or buy thatll battery back the
>clock?

Easiest thing would be to find an old Magic Sac cartridge (the early MAC emulator) minus the ROMS - I believe if you pop a battery in there, it has a clock that will work fine for you. I personally use the clock built into my Deskcart cartridge...

>2. Whats the difference between various ST models. Such as the ST vs
>STE. I know the E means Enhanced or something. I am wondering if its
>possible to modify my 520STFM to be an STE? Also, in a coupla months,
>I plan to upgrade my RAM, either 2mb or 4mb, and also want to know
>whats the difference between an upgraded 520ST, to say a Mega-2 or
>-4?

There are various differences between the ST and STe series, most notably enhanced color (4096 colors, instead of 512 palette) and stereo sound. Also a newer TOS (like DOS on the IBM), etc. An STe owner could better compare... Oh, a biggie: ALOT easier to upgrade the ram of an STe - just pop in some SIMMS (whereas with the ST you need a memory board setup to upgrade)... As for Mega, I believe the main difference is a couple extra expansion port(s)....

>3. Anyone have TOS 1.4 they wanna sell? :-) Ive the 6 chip version 1.0,
>and want to upgrade. Im sure that someone must have upgraded their

Nah, I like my 1.4s...

>4. Finally. CPU accelarators? I see in a mag or two that one company
>makes a 16MHz 68000 thats pretty simple to install. Is there any
>other CPU replacements, like an 020 or an 030? (dont tell me get a
>TT, I never buy computers new :-) I know that these must exist, but
>am looking for opinions on the 'best' (cost effective and also
>installation, and how good it is in speeding up the processor)

There are two 16mhz 68000 upgrades - by ICD (AdSpeed) and the Turbo16 by Jim Allen. A 20mhz version by Jim Allen is supposed to be coming soon. Then there is the Gadgets by Small 68030 upgrade, which I believe is at 32mhz (Dave?)...

TT is rumoured to see a new incarnation "sometime soon".

>Innovation and high tech is made by Bill Gates, Steve Jobs
>and others but not in Borregas Avenue...

Mustn't forget to mention Dave Small. I haven't seen an SST yet but heard
they were shipping. If you can get a 50 MHz 68030 in one of those, it'll
burn the pants off anything that has yet been mentioned here.

>The old GDOS had only few driver...
>The new FSM-GDOS has not yet been released...

TOS has yet to be junked. In all seriousness Atari, why not have a REAL OS
in ROM and the option to load TOS and GEM from disk for backward compatibility?
There is nothing fundamentally wrong with the Atari hardware, though there are
certain limitations which I feel should not be imposed.

The TOS ROMs are a joke though. (Does anyone know which compiler they used?).
I would guess 20% or more of the space in them is wasted because the C
compiler didn't optimise the code. There is plenty in need of revision.
It seems the same compiler has been used for all TOS versions up to at least
1.62. Even recent TOS versions have backward compatibility to features of CP/M
which have never been used on Atari ST/TT hardware products. Until very
recently there has been no support for HD floppies. The list goes on ......

If the hardware wasn't useable and some good quality application software
packages then I wouldn't have stuck with Atari. Despite their failings,
the equipment (with third party support) is still a fair cut above the rest.

Hi John,
The Multi I/O (MIO for short) is an interface for the Atari
800XL's and 130XE's. It provides a SCSI/SASI host adapter (for connecting
hard drives to the Atari 8-Bits), a parallel printer port, a RS232 serial
port and either 256k or 1m of RAM that can be configured as either a RAMdisk
and/or a print buffer/spooler. The video actually does not work, it was
intended as a future 80 column RGB upgrade, ICD canned the upgrade.
The MIO is strictly for either the 800XL or the 130XE, a ST user has no
use for it; unless of course you decide to an 8-Bit! The MIO is a handy piece
of hardware, a must for anyone who wants to run an 8-Bit BBS. A used 256k unit
is worth around $100, a used 1m unit is worth around $250. ICD still (for the
moment at least!) sells them. Bye.....

Luis

>Can anyone shed some light on this?

loadspx needs a file named madonna.spc (included in the sources of loadspx
in c.sources.a.s) and a color monitor (of course 8-)). Both files *must*
be in the same dir.

You may rename any SPC or SPU into MADONNA.SPC and run loadspx to show it.

Hope this helps,

Just some random mutterings...

Have you tried the version of lharc in the gnustuff directory on a.a? I've yet to find a .lzh which it couldn't handle. The difference in compression ratios between zoo and lharc is quite considerable, up to 30%. Arc is somewhere in between.

My complaint with lharc is that's its's too damn slow. I still mainly use zoo because I just can't be bothered to spend hours waiting for lharc.

As long as people stop using the brain-dead Arc I really don't mind which one they use... let's hope we can avoid tar and compress, at least until Minix support in MiNT is better. :-)

Source record: 231024

In my never-ending quest to get TeX running ROUTINELY on my ST (without, to the best of my knowledge, ever having spoken to anyone else who knows or cares about TeX AT ALL), I've run into another 'challenge'. Near as I can figure it, the version of plain.bas that was posted to the binaries group here a while back had printer definitions loaded from a 'localization' file called waits.mf (thank you for memfile, Gribnif people). Rather than discarding this version of plain and making a new one, I'd prefer to know what it contains. Does anyone have waits.mf? Would it be possible (reasonable) to post it to comp.sources.atari.st, since it was part of the source for a binary that was distributed in in comp.binaries.atari.st? If someone has it and doesn't care to post it, please email me a copy.
Steve saj@chinet.chi.il.us

586. Splitting up large binary files.

Newsgroup: comp.sys.atari.st

Message-ID: <N62OSQT9@linac.fnal.gov>
Source record: 231022

A friend of mine has been trying to get Emacs running on
his 1040ST. He collected emacs-18.55.zoo (sic) from
atari.archive. This file is too big to fit on a single DD
floppy. Soooo, I advised him to try "split"ting it on one
of the Unix boxes at work, and then transferring it to floppies
via a Mac--using Apple File Exchange, and formatting the
disks on the Mac--and then recombining the individual parts back on
his Atari using "cat."

With a "cat" collected from cs.uni-sb, he was able to do this.
Byte count checked out ok. But "zoo" bombed immediately
when it tried to work on the result, reporting a corrupted
header. He assures me he used the proper modes of transfer
along the way. Can someone tell us what went wrong, or better,
how we should have gone about this in the first place ?
Finally, when this is all done will it have been
worth the effort ?

Source record: 231023

Hello,

I have a DS1216E Smartwatch from Dallas Semiconductor. When installed in the ST and used with a program called TD 1.3 it will automatically set the system time and keep it in its own little memory. It is an intelligent socket. But a hardware mod is required to use it with the 1040ST. In the docs circa 1987 a company Transformation Technologies is listed as having a $15 solution to this problem, and a tel # for more info. Calling that number results in someone answering who has never heard of TransTech. I called information in CA, they have no listings either. Does TransTech exist anymore or did they go under? Anyone with any suggestions please reply. I may just do the mod and forget about the possible consequences.

590. A.A. Gnustuff Status Update

Newsgroup: comp.sys.atari.st
Date: 1991-06-20 17:11:34 UTC
From: gjh@hplb.hpl.hp.com
Message-ID: <GJH.91Jun20181134@ghiggins.hpl.hp.com>
Source record: 231029

Progress indeed:

GCC 1.40 sources:
~ftp/atari/gnustuff/tos/gcc/src/gccsrc00.zoo

GCC 1.40 binaries (gcc.ttp, gcc-cpp.ttp, gcc-cc1.ttp)
~ftp/atari/gnustuff/tos/gcc/bin/gccbin00.zoo

GCC 1.40 utilities (gcc-ld sym-ld, etc) now at PatchLevel=20
~ftp/atari/gnustuff/tos/util/src/utlsrc20.zoo
~ftp/atari/gnustuff/tos/util/bin/utlbin20.zoo

These have been freshly compiled (they're still steaming) with the new A.A.
GCC cross-compiler. I haven't yet exercised them. Consider them as an alpha
release for the meantime. I will do gdb next, then move on to the ancillaries
(tar, patch, flex, etc).

BTW - I notice that gnugdb.olb is half the size of the old gnugdb.olb (from the
jrd port), I'd treat this all with caution at the moment.

Sorry, I have to disagree. The NEC may be the best (it's certainly very good), but there are definitely other monitors worth using, often less expensive. The Sony 1302/1304 make very nice ST monitors, and for cost I don't think you can beat the PanaSync 1391, locally seen at $329. Don't get the 1381, it can't sync to 15.75KHz, but the 1391 can.

this is not the point. the fact that i can (eventually) FIND a version
of lharc to unpack any particulary archive may sound like there is no
problem at all. there is. the SEARCH for the lharc version to do it IS
the problem. until all the various lharc developers (many of whose work
by itself is excellent, BTW) get together and standardize an extensible
file format, this is basically still russian roulette.

>My complaint with lharc is that's its's too damn slow. I still mainly use zoo
>because I just can't be bothered to spend hours waiting for lharc.

yes, this, too is a major problem. i consider MY time far more valuable
than the few pennies i save on floppies (which can cost as little as $0.35
each). my time (to me, anyway) is more like $50-100/hour. if i can archive
say 10 MB/hr with arc and only 5 MB/hr with lharc, and lharc saves me
50%, then i wasted $50 of my time to save maybe $2 on disks. hardly worth
it. after all, we are only on the planet for a short time. i'd hate
to waste it waiting for lharc :-) (or continuing this debate as well)

>Thanks in advance.
>A.Y.

Hi Allen,
You could build your own cable to connect a multisync-type
monitor to your Atari, but it can be a major pain in the.... well you... butt!
You can also buy a interface such as the OmniSwitch (from Talon) or the IB
MultiSwitch (from IB Computers); and then get your own monitor such as the NEC
3D, the Mitsubishi DiamondScan or the Sony 1402. Although getting any of these
monitor/interface combos will cost you around $600 (give or take!).
Or (here comes... the shameless plug!) you could just get yourself a
Omnimon monitor from Omnimon Peripherals (it is a multisync monitor and
interface already packaged for the Atari's)!EBm). The phone is 800/429-OMNI.
It costs the same as doing it yourself.

luis

P.S. I have no affiliation with Omnimon Peripherals, other than I am aware of
thier products.

>don't think you can beat the PanaSync 1391, locally seen at $329. Don't get
>the 1381, it can't sync to 15.75KHz, but the 1391 can.
>--

I was thinking about getting the Panasync C1391, but then I read this (from the
file "multsnc7" in the multisync archive uploaded to a.a) :

[start of quote]

The following is the list of monitors recommended by Talon:

1.) Acer Multisync
2.) Mitsubishi Diamond Scan #1381
3.) Samsung Model #CN 4551

Talon's Comments are
---
1. You must use a "Multisync" and NOT a "Multiscan" monitor. The best
way to find out which monitor you have is to see if it can "Auto Scan"
in both horizontal and vertical.

2.) Your monitor must be able to receive an "Analog" signal.

3.) The frequency range of your monitor must be as follows;

Vertical Auto-Sync 15 - 36Khz or better
Horizontal Auto-Sync 45 - 90Khz or better

4.) The "Dot Pitch" of your monitor should be at least .31mm.

5.) Frequency band width should be at least 35Mhz or better.

It was this last which was hard to match. I found a cheaper monitor
which looked like it would work, but the frequency band was only 30Mhz
and it put too much strain somewhere and started to overheat.

[end of quote]

The Panasync C1391C (which is the model described by the spec sheet here on
the desk) meets all the requirements EXCEPT one . . . you guessed it, the
last one (Frequency Band width isn't listed on the spec sheet, but Video
Band width is (30Mhz), so I'm assuming they're referring to the same thing).

Is this really a big deal? Does anyone out there have one of these working
with an ST(e)? Enquiring minds want to know . . .

I posted something along this line, and was told that there are several
utilities available for the mac that allow it to read/write IBM format
disks (which of course work on the ST). I seem to remember that at least
one of these packages is PD or shareware.

Probably not worth the effort. Why not use JOVE: in a.a I believe.
It works well, and is much smaller than emacs - but lacks some of emacs
bells and whistles. But it's good.

If you are using Spectre 3.0you can use:

AccessPC
Dosmounter
Apple File Exchange (text only I think)

I tried both AccessPC and Dosmounter, and they work fine, AccessPC even
correctly formats MSDOS disks. The above also works if you only have the
Spectre 128 cartridge, without the GCR

Hope this helps

(Note: I have never seen a PD or shareware program that does the trick; the
programs above were only on loan so I don't know their price)

++ Finally, when this is all done will it have been
++ worth the effort ?

I seem to have collected a more robust version of emacs than the one originally
ported by Edgar Roeder. I will upload it to atari.archive into the
gnustuff/tos/Emacs directory --- look for emacsbin.zoo. It'll fit on a DS disk.

I have had problems with zoo, split files and Mac xfrs as well. I suspect that
it's something to do with CR+LF or not. I will arrange for the emacs.zoo files
on atari.archive to be split into DS-disk-sized files which can be catted back
together on the ST.

>> on the ST, I'd like to make an appeal to those who are actually doing the
>> work: please, please, please make sure that it does NOT mangle filenames
> huh, all you got to do is set the env variable UNIXMODE
>appropriately. see UNIXMODE.doc in the lib sources. it will be
>perfectly happy to use the other env variables (GNULIB etc) with
>forward slashes in them.

Can't we get away from this UNIXMODE thing, a la Eric Smith's MiNT library? It does seem silly to have two diverging libraries when one would suffice. I do _not_ use your library (because I'm a MiNTer), so I don't have any info on UNIXMODE. The foward slashes are not a problem, it's the fact that all the names are truncated to fit 8.3 and converted to uppercase.

These are fairly small gripes, but when they're so easily avoided, why do we need the extra hassle?

Here's hoping for gcc 2.00... :-)

>utility included/available?

Yes, there is a utility called Transverter which allows fairly free transfer
between ST format disks and MFS format Mac disks. I have an MFS HD partition on
under Spectre which I use as a source/destination area for file transfers. It
allows Binary or Text format and with the Binary, enables Spectre to recognise
the file types (.SIT, etc).

++ I posted something along this line, and was told that there are several
++ utilities available for the mac that allow it to read/write IBM format
++ disks (which of course work on the ST). I seem to remember that at least

You should use modes.mf, the successor of waits.mf. It has the same functionality and much more. It is available from the major TeX archives.

>There is nothing fundamentally wrong with the Atari hardware, though there are
>certain limitations which I feel should not be imposed.

TOS is usable. TOS is useful. TOS isn't more bug-ridden than other OS's.
And personally, I think GEM is a real gem. It has all the potential
to rival the MacOS. So don't junk TOS, Atari. Instead, give us MultiTOS
soon. Besides, you can run lots of other OS's on the Atari NOW: OS/9,
Minix, MacOS, QL OS, MS DOS, Mirage... just to name a few.
And with the advent of Atari Unix we also have a full-featured SysV.4.
Think about it.

>The TOS ROMs are a joke though. (Does anyone know which compiler they used?).
>I would guess 20% or more of the space in them is wasted because the C
>compiler didn't optimise the code. There is plenty in need of revision.
>It seems the same compiler has been used for all TOS versions up to at least
>1.62. Even recent TOS versions have backward compatibility to features of CP/M
>which have never been used on Atari ST/TT hardware products. Until very
>recently there has been no support for HD floppies. The list goes on ......

The XBIOS floppy routines worked with HD drives from the day they were
created, likewise for BIOS and GEMDOS. Now, isn't that a sign of
thoughtful design? You might start picking on other design mistakes
like the troublesome GEMDOS I/O redirection, but HD drive support
is a very bad example.

With machines speeding up considerably and speeders all over the place,
the need for fine-tuning the ROM code diminishes. It's more important
for Atari to have control over the various TOS development lines, and
this is near to impossible to do with hand-optimized code. And the only
reason why Atari does not use Turbo C officially (though developpers at
Atari Sunnyvale are said to be allowed to use their favorite dev
package) is that it is not available in the US - no English docs and such.
With the Turbo C developpers falling off from Borland and starting with
a new distributor, this situation may change soon.

>If the hardware wasn't useable and some good quality application software
>packages then I wouldn't have stuck with Atari. Despite their failings,

I happen to have written a GIF2SPU converter using 4096 colors. SOME pictures are converted really nice (try SUNSET.GIF currently on alt.binaries.pictures). I'll post it monday, if I won't forget. It DOES make 'corrupted' GIF pictures, i.e. it uses all 16 palette entries, and spectrum.prg behaves real stupid with them.

> his Atari using "cat."
> With a "cat" collected from cs.uni-sb, he was able to do this.

I don't know this "cat" version, but most "cat" versions for the
ST work in `text mode', not in `binary mode'. This means they
ignore `CR' in a line (not all) and wrote `LF' as `LF/CR' pair.

Try this: Wrote your own version of `cat' and be sure that you open
the input files and the output file in binary mode!

-bernd

PS: I use GnuEmacs to recombine binaries ;-)

613. ST and Multisync

Newsgroup: comp.sys.atari.st
Date: 1991-06-21 12:51:45 UTC
From: larserio@IFI.UIO.NO
Message-ID: <CMM.0.90.2.677508705.larserio@kvart.ifi.uio.no>
Source record: 231050

```
Multisync monitor switchbox and cabel (this is tested and works)
"""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""

If you want monochrome your monitor must handle 71 Hz frequency
NOT all monitors do this - To be sure - Test before you buy it!

Multisync side (no pin number - they depend on your monitor outlet)

Red Green Blue HorSync VertSync Ground
| | | | | |
| | | | | |
SW1---SW2---SW3-------. | | |---SW4---.
| | | | | | | |
| | | | | | | |
Red Green Blue Monochrome HorSync VertSync Ground MonoDetect
7 6 10 11 9 12 13 4

Atari ST, STE or MEGA STE side (number as in operating manual)

The switch you need must be of the type with 4 pins in that can be
switched between 2 x 4 pins out (two choices) and works like this:

Switches 1,2,3: When in color red, green and blue passes straight
--------------- through without contact with each other or mono.
When in monochrome they are all disconnected from
ST RGB and instead all connected to ST monochrome

-------- ST RGB (in color mode)
Monitor --------- SW
-------- ST Mono (in mono mode)

Switch 4: Open in color, monochrome detect not connected.
--------- When in monochrome monochrome detect is connected
to ground (this tells the ST it's in monochrome).

Monitor GND --------------- ST GND (always connected)
SW ------ ST Mono Detect (in mono)

Don't worry, the worst bit isn't making this - it's getting the
13-pin Atari monitor connector for the ST side and solder it !!

614. What archiving format?

Newsgroup: comp.sys.atari.st
Date: 1991-06-21 15:27:22 UTC
From: D.B.Barratt@newcastle.ac.uk
Message-ID: <1991Jun21.152722.17873@newcastle.ac.uk>
Source record: 230956

I'm a bit confused regarding the different formats available for archiving files e.g. arc, lharc, zoo etc. Is any one of these formats more efficient or reliable than the others, if so does this not make the others somewhat redundant? Is there any compatibility between the different formats?

In other words which format should I be using to archive my files?

Cheers,

Dave

616. Hard Disks

Newsgroup: comp.sys.atari.st
Date: 1991-06-21 16:39:45 UTC
From: malay@sae.com
Message-ID: <1991Jun21.163945.19610@sae.com>
Source record: 230957

A month ago I purchased a 1040STe and have upgraded it to 4 Megs. I now want to buy a hard disk in the $500-$600 range preferably >= 50 Megs and not slow with clock and ICD Adv+. Anybody got anything to say about these choices:

D & P Computer's 85 MB 28 MS $584
Joppa Computer Products 82 MB 19MS $609
Toad Computers 85MB 24MS $599
L & Y Electronics Supra 110 MB $599
Rising Star Computers ICE Systems 85MB $579

If you know of anybody else in this price/performance range that I should consider - explain ?

Bob Malay

617. Gnu Emacs under MiNT?

Newsgroup: comp.sys.atari.st
Date: 1991-06-21 16:46:45 UTC
From: peter@geog.ubc.ca
Message-ID: <1991Jun21.094645@geog.ubc.ca>

618. Another Atari write-in campaign...

Newsgroup: comp.sys.atari.st
Date: 1991-06-21 18:16:38 UTC
From: lch3e@holmes.acc.Virginia.EDU
Message-ID: <1991Jun21.181638.21970@murdoch.acc.Virginia.EDU>
Source record: 230953

OK, folks, it's time for yet another write-in campaign. Believe it or not, they ARE effective (when a reasonable number of people write); and this is one of the most important issues I've seen in the ST world.

WORDPERFECT FOR ATARI
Z*Net announced weeks ago that WordPerfect was going to end its Atari support after a cancellation of a major order by Atari Germany. The story continues to develop. The German order was for version 5.1 of WordPerfect, which is not yet completed and may now never be.

WordPerfect programmers had prepared the code and had grafted major parts of the NeXT computer version of 5.1 into what was to be the Atari version. Full FSM GDOS management and compatibility was also integrated, making the Atari WordPerfect 5.1 perhaps the most advanced version that would have been available on any platform.

However, after
Atari Germany canceled their advance order of 10-15,000 units under pressure of German developers, WP contacted Atari in Sunnyvale. Reports vary somewhat, but the result of that talk seems to be that Atari Corp will not at this time back WordPerfect by assuring a minimum order.

WP has left the matter open-ended, and does plan to
continue the periodic bug-fixes and minor tweaks of the 4.1 version that is available for the Atari. Some Atari officials are working to reverse the situation and persuade all parties to take whatever measures needed to assure production of WordPerfect 5.1 for the Atari.

Ataris' developer man, Bill Rehbock, has asked Z*Net to clarify what he is looking for in support for a new revision of WordPerfect. The company is hesitant to release version 5-point-something because of fears of insufficient sales. Bill has been actively soliciting reports from users as to their actual reasons for buying/ not buying WordPerfect to date, including bug reports.

So far, Bill tells Z*Net that his mail has
been primarily negative, bashing him and Atari for flubbing the WP deal.

What he NEEDS are letters to take with him to WordPerfect in July. Those letters should say what YOU think about WordPerfect, both in the current incarnation for the Atari and what would make you buy a new version. Reasons you didn't buy the existing version are important too. Atari Corp, Bill Rehbock, 1196 Borregas Blvd, Sunnyvale, CA 94088. And /or direct to WordPerfect, 1555 North Technology way, Orem, UT 84057.

619. Geneology program for the ST

Newsgroup: comp.sys.atari.st
Date: 1991-06-21 18:33:55 UTC
From: pbh@jake.cc.wayne.edu
Message-ID: <1991Jun21.183355.12345@cs.wayne.edu>
Source record: 230961

I'm having a family reunion next year! We had a really great one last year where we all said it'd be really nice to have a family tree as a keepsake, but no-ones jumped on it yet. I'd like to have a try at in, only if I can find a geneology program for the ST. PD or commercial. Have found lots of PD stuff for the PC, but I don't think I really want to depend on PC Ditto (soft version) for any serious work.

Anybody?

620. MSDOS 5 on ICD drive via ATSpeed

Newsgroup: comp.sys.atari.st
Date: 1991-06-21 20:30:33 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1991Jun21.203033.22485@rodan.acs.syr.edu>
Source record: 230972

I am running ATSpeed on my ST with an ICD hard drive. ATSpeed allows you to reassign hard disk partitions to facilitate booting gem and msdos. So, I boot my ST off c: and msdos off d: (under msdos, the names appear reversed, i.e. c: from ST shows up as d: under dos and d: from ST shows up as c: under dos). Everything was fine until I upgraded to MSDOS 5. For some reason, it will not recognize the d: drive (which is really c: under GEM). There seems to be some sort of incompatability between what the icd boot requires and what msdos 5 needs to read. I have reformatted the drive in question under msdos 5, but then the ST is not able to boot. When I fix the drive so the ST can boot, msdos 5 will not recognize the drive. Does anybody have any idea why this is so? and/or if there is a fix? The older versions of dos cause no problem...Which is good, I guess, because at least I have a fall back position.
Thanks very much for any help you can offer.

624. Expanding a Supra HD

Newsgroup: comp.sys.atari.st
Date: 1991-06-22 05:33:21 UTC
From: i9853100@ivax.ccit.arizona.edu
Message-ID: <21JUN91233321@ivax.ccit.arizona.edu>
Source record: 231042

I have a Supra 20 meg HD which uses a Rodime embedded SCSI mechanism. Can
I upgrade to a higher capacity drive by just swapping out the mechanism?
(I was thinking of using a Segate ST-157N 49 meg drive). Also, I have version
2.62 of the Supra software. Would this software be able to format the drive?
Also, if there newer versions of the software, what are the differences?
Using RATEHD.PRG, my current drive checks out at about 220 k/s and over
100 ms avg access (Very slow!). Would changing the drive mechanism speed this
up?
Help with any of these questions would really be appreciated. Thanks!

AS> archives.

How to get modes.mf from the archive at
Dept. of Computer Science, Utrecht University:

NOTE: In the following I have assumed your mail address is john@highbrow.edu.

Of course you must substitute your own address for this. This should be
a valid internet or uucp address. For bitnet users name@host.BITNET
usually works.

by FTP: (please restrict access to weekends or evening/night (i.e. between
about 20.00 and 0900 UTC).

ftp archive.cs.ruu.nl [131.211.80.5]
user name: anonymous or ftp
password: your own email address (e.g. john@highbrow.edu)
cd /pub
don't forget to set binary mode if the file is a tar/arc/zoo archive,
compressed or in any other way contains binary data.
get TEX/MF/modes.mf

by mail-server:

send the following message to
mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send TEX/MF/modes.mf
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

You could try using STZip, it process zip files (compatible with PKZip on PC), is faster than LHArc 1.13.19, compress roughly the same (better on big text files, worse on very small files), and has a built-in GEM interface.

Should appear in comp.binaries.atari.st soon.

629. Atari-To-Amiga Convert Info Source!

Newsgroup: comp.sys.atari.st
Date: 1991-06-23 01:27:02 UTC
From: ai065@cleveland.Freenet.Edu
Message-ID: <30257@know.pws.bull.com>
Source record: 230968

First let me begin this message by paying Atari users a kind remark...Atari users are smart, much in the same way as Amiga owners. We have both choosen our machines based on the facts, and the facts are that IBM and Apple computers don't offer us power for the price. IBM is too controlled by dull and generic standards, and Apple almost has to sell machines at three times what they are worth in order to keep up their BMW-like image. We have choosen our machines because they were simply the best (one more so than the other :')) for the price.

As of late, Atari has taken a sudden turn for the worse. The new machines didn't live up to their promise of having better features than their Amiga twin. Software vendors, shows, and even magazines are jumping ship as a result of the somewhat flat sales of the new machines. Even Atari's best feature, good MIDI software, is weakening as several of those authors port their software to the Amiga. Atari has gone deep into debt and not even a rumor of a totally new computer, if that rumor existed, looks to offer hope.

On the other hand, Amiga sales are higher than ever. New prices, better outlet exposure, recent introduction of high quality professional software, new "media" hits (Toaster, CDTV, AmigaVision), recent introduction of leasing programs and onsight service that even IBM and Apple don't offer, all of this and more has resulted in a big year for Commodore. Sales are way up. Even the 3000 is sold out right now. The recent trade-up program, which will give you massive discounts if you already own a Commodore, has put the 3000 in reach for even lowly Vic-20 owners. The Amiga went well over 3 million units some months ago and, if sales continue at this pace, could go over 4.5 million by the end of this year. It is said that Commodore just experienced their most profitable quarter in history, and Commodore stock is higher than it has been in years. CDTV, which many predict to be the biggest electronics smash since "Nintendo", has received much press and will be advertised by Commodore in a big way this fall.

As a result, the trickle of Atari users switching to the Amiga has (in my *limited* view) turned into a flood recently. Because of my exposure through messages here on Cleveland Free-Net, I have received several requests for information to smooth the conversion from the Atari to the Amiga. I do this as a service to fellow computer users. If you need any advice on file conversion, where to buy Amiga-related hardware for the best price, information on the Atari ST emulators out for the Amiga, or have any other questions related to the Atari-to-Amiga conversion process, please feel free to write me via Email. Please note: I'm not impressed by stupid remarks and swear words from those who still love their Atari. You have every right to stick with your choice. Please allow others to do what they feel is right.

Tom

Why purchase a MAC when an Amiga with the same CPU will run 99% of all
__ MAC software..and FASTER at that?! The same can be said of the IBM and
__/// Atari computers, and I can run those in a window. IBM's greatest sales
\XX/ tool is ignorance on the consumer's part. IBM=(I)'ve (B)een (M)islead.
A If you want to be popular then buy a MAC....If you want to be powerful
M then buy an Amiga..and use all that money you save to buy friends. :')
I Classic=B&W, no blitter, no DMA, almost no sound, almost no expansion,
G price tag of $1000. Amiga 500=4096 colors, DMA galore, great sound, an
A 86 pin expansion port, price tag of $500. Confused? Only the Amiga!!!!

630. What is wrong? How to fix?

Source record: 230969

I am collecting information, I have been for sometime on all the things that people say is wrong with Atari.

Some say that Atari is only considered a game machine in some countries.

Some say that the technology of Atari computers isn't enough to compete against other computers.

Some say Atari doesn't advertise enough.
Others say that Atari Corp. doesn't support its customers as it should.

WHAT IS WRONG WITH ATARI?

This is what I would like to know from you and I would also like to know how you would fix it if you had any control of what was happening.

Please respond to me in e-mail since I don't think people don't want to read this string.

Also please be aware that I understand all computer companies have their problems not just Atari. Atari has some positive things going for them but all I am interested is the things that is wrong with Atari.

Thanks.

P.S. Please give your country's name as well as if you are a user, dealer, or developer.

631. Re: Atari-to-Amiga junk

Newsgroup: comp.sys.atari.st
Date: 1991-06-23 04:35:26 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <9106230435.AA12185@cwns5.INS.CWRU.Edu>
Source record: 230964

I have just read the message posted by Thomas Hill, SysOp of the Commodore SIG on the Cleveland Free-Net.

There is no proof that Atari is doing bad anywhere. There is no proof that anyone is switching over to Amiga and if there are some, I am sure the same amount are switching to the ST.

Thomas Hill is famous for attempting to "scare" Atari users into becomming Amiga users, especially on the Cleveland Free-Net. I should know, I am the Atari SIG Manager on the Cleveland Free-Net.

There is no proof and frankly, I believe Tom just made up information on the new Atari computers being a flop because he doesn't really know and would like to think so.

Many claim, especially developers that the TT030 will be easier to develop quality software on the TT than the Amiga. I'd like to wait and find out. After all, the TT030 hasn't even made it to the U.S. yet! It is at least one-year newer than the Amiga 3000 and I'm sure Atari had enough time to examine that of its competitors to bring you- a superior machine.

The Mega STe will be selling for $1400 with 55 meg hard drive, 2 megs of RAM, LAN, etc. at an Atari Dealer in my home town. This is an amazing price and I definitely do not see failure there.

Atari has had trouble manufacturing enough computers to compete properly.

It is now over this problem with contracts with several new factories.

Don't give up on your computer yet folks, because if you let messages like Tom's frighten you, Atari is doomed because of you not because of them.

And don't worry about ST computer users switching to Amigas on Free-Net. They would be switching a computer that is supported by a SIG with a great amount of information to a computer with a SIG that only has "my computer is better than yours" messages throughout it.

Article #439 (444 is last):
Newsgroups: freenet.sci.comp.c64.forum
From: ai065@cleveland.Freenet.Edu (Thomas Hill)
Subject: USENET REPOST: Atari In Europe
Date: Sun Jun 16 16:47:26 1991

What follows is a series of messages from the Atari UseNet SIG. They represent the down hill trend at Atari right now. While thumbing through the Atari messages I was taken by the number of "For Sale" messages being posted. Read into this what you will. Also, if any of you Mac users think Atari and Commodore activity has always been about the same level, I would suggest you go to the few Atari SIGs for a quick look, then go to the Amiga SIG (# 5) and take a quick look around all those special interest SIGs within it. Things are hopping at Commodore these days. Things at Atari are...Well, let's let the Atari message traffic speak for it's self. I'd also like to mention to my fellow Amiga users out there what this could mean to Commodore. With Atari out of the picture Commodore would be by it's self in the < $1000 market. With the recent rush of Atari users switching to the Amiga, this "rush" could soon turn into a flood.

Article #28178 (28194 is last):
From: grahamt@syma.sussex.ac.uk (Graham S Thomas)
>Newsgroups: comp.sys.atari.st
Subject: Re: How is Atari doing in Europe?

From article <1991Jun14.010821.9903@noose.ecn.purdue.edu>, by
yegerleh@vivaldi.ecn.purdue.edu (James D Yegerlehner):
> I don't think Atari is making much of a splash over here (yet?)
> with the new STEs and TTs, but can any of you guys over in Europe
> say how the new machines are being received there? Is Atari
> maintaining the significant market share that it once had?

I'm fairly sure Atari's market share in the UK is declining. Most STs
here have been sold as games machines, and judging from the relative
amounts of software in the shops and the number and thickness of
magazines on the newsstands, the Amiga's winning hands down in that
arena.

Anything else has been niche marketing. The TT is more expensive here
than in some other countries, partly because Atari don't expect to sell
many. The Mega STE hasn't even been released here yet - it's just been
delayed even further until the beginning of July.

Atari are still selling a fair number of STFMs (still!) and STEs, and
the existing number of installed machines means that games and music
software will continue to be produced here, along with the occasional
non-games product. Also, Atari UK have started to advertise the ST as a
'serious' computer again. But, in my opinion, it's too little, too
late. The best is not yet to come.

634. Mint and big screen

Newsgroup: comp.sys.atari.st
Date: 1991-06-23 08:55:32 UTC
From: lahtinen@nic.funet.fi
Message-ID: <1991Jun23.085532.24428@nic.funet.fi>
Source record: 230970

I am using my Atari with a big screen (Matrix C32) and would
like to use Mint and GEM together, but so far I have only succeced
it in normal ST-resolution. For some reason the program GEM.PRG
does not like the driver of the big screen.

Does somebody has a solution? Otherwise Mint is working fine and
also mgr is nice on 800x600 resolution.

aa399@cleveland.Freenet.Edu (Len Stys) writes:

>I have just read the message posted by Thomas Hill, SysOp of the Commodore
>SIG on the Cleveland Free-Net.

Nice to see you here on the Atari UseNet SIG, Len. I'm afraid you've once again made the mistake of calling me the Sysop of the Commodore SIG on the Cleveland Free-Net. Let's hope this is the last time I have to say this... I am not the System Operator of the Commodore SIG on Cleveland Free-net.

>There is no proof that Atari is doing bad anywhere. There is no proof that
>anyone is switching over to Amiga and if there are some, I am sure the same
>amount are switching to the ST.

Even some members of your SIG in very high "positions" have asked me details on switching to the Amiga. I was asked to not print their names, so I won't. Since your an avid reader of the "computer forum", you should know that I always complain that people make statements without any proof. I'm a big believer in facts, and putting your money where your mouth is. Much of the source material for these statements comes from your very SIG. Exactly what statements don't you agree with? I have source material for everything down to the Atari music authors switching to the Amiga. I like to think that I never make a remark without the facts to back it up. Please try to do the same.

>Thomas Hill is famous for attempting to "scare" Atari users into becomming
>Amiga users, especially on the Cleveland Free-Net. I should know, I am the
>Atari SIG Manager on the Cleveland Free-Net.

This statement is uncalled for. I never try to "scare" people into buying an Amiga. I present the facts and allow you to make up your own mind. Again, most of the information I post simply came right from the MAC or Atari SIG. I do "try" to inform people. I believe that most people buy a computer with no real knowledge of how it compares to other systems. This is what I am trying to change.

>There is no proof and frankly, I believe Tom just made up information on the
>new Atari computers being a flop because he doesn't really know and would like
>to think so.

I can even give you remarks from Atari users in this very SIG to support that statement. And I never make up information. To do that would be a turn from the facts. The facts our that the Atari sales are slowing. The initial sales flow of the new machines was mainly due to Atari users upgrading.

>Many claim, especially developers that the TT030 will be easier to develop
>quality software on the TT than the Amiga. I'd like to wait and find out.

I'd love to hear your facts to support this statement. The Amiga is well known for it's excellent library of support routines. I've always heard people say that the Amiga is a dream to program on. Never heard it the other way around.

>After all, the TT030 hasn't even made it to the U.S. yet! It is at least
>one-year newer than the Amiga 3000 and I'm sure Atari had enough time to
>examine that of its competitors to bring you- a superior machine.

Being released a year after the 3000 has nothing to do with it being a newer machine. This just enforces Atari's rap of showing products long before they are ready. Remember the big discussion we had about the new Atari computers? You liked to call them "totally new computers", while I made the point that they are simply the old machines with minor upgrades here and there. They still didn't offer better special chip ability than what the Amiga already had. These are repackaged machines, not totally new ones. I wish Atari would have released a totally new line from the ground up. It would have made the market competitive again and it probably was the only thing that could have saved them.

>The Mega STe will be selling for $1400 with 55 meg hard drive, 2 megs of RAM,
>LAN, etc. at an Atari Dealer in my home town. This is an amazing price
>and I definitely do not see failure there.

Not a bad price, but not the best price either.

>Atari has had trouble manufacturing enough computers to compete properly.

I find the recent remark on this curious. Atari has had trouble selling computers. What makes you think fixing a plant problem will increase sales?

>And don't worry about ST computer users switching to Amigas on Free-Net.
>They would be switching a computer that is supported by a SIG with a great
>amount of information to a computer with a SIG that only has "my computer
>is better than yours" messages throughout it.

Len, once again your not exactly right. Len had tried to make it sound like this discussion has gone on in the Commodore Amiga Forum on Free-Net. Not so. A new section was set aside, called "The Computer Forum", for all computer users to discuss and compare the powers of their systems. This is not an Amiga board, not a Commodore board, but a board for the discussion of all computers. Saying that the Amiga SIG does not support it's users is a remark based in no fact. I know your SIG supports it's users. Never said it didn't. If you'll kindly read over a small list below of titles found in the Amiga SIG then I think we can clear up this small misunderstanding...

> Even Atari's best feature,
> good MIDI software, is weakening as several of those authors port their
> software to the Amiga.

Ever met a professional producer, Tom? We use the best programs available on any computer: C-Lab's CREATOR/NOTATOR for sequencing, Digidesign's ATARI SOUND TOOLS for digital audio recording/editing, and POLYFRAME for patch editing. None, I repeat, NONE of these have been ported to the Amiga. And unless future Amiga machines clean up the severe MIDI timing problems they've got now, they never will be.

> On the other hand, Amiga sales are higher than ever.

Bzzzt! Commodore just posted its worst figures in 4 years.

> If you need any advice on file conversion,
> where to buy Amiga-related hardware for the best price, information on the
> Atari ST emulators out for the Amiga, or have any other questions related
to

I'll save you the time, Tom. Amiga ST emulators blow. They're all slow, buggy, and none, I say again NONE, work properly with any MIDI software whatsoever. Makes ME want to rush out and buy one, so I can play 32-million-coloured games instead of all that WORK I'm getting done now.

> I have received several requests for
> information to smooth the conversion from the Atari to the Amiga. I do this
as
> a service to fellow computer users.

You noble soul! The self-sacrifice! In turn, I offer to help YOU smooth the conversion of your lips from their present location to my sweaty posterior. I do this as a service!

Tom, I haven't read such a heap of bunk it a long time. If you're frustrated that your computer isn't being used in any professional environment, fine. But don't come over here and shovel propaganda and outright false statements in an effort to get others to join you in your malcontence. Grow up. A "my computer is better" rant under any other name smells equally bad, no matter how you may attempt to dress it up.

From: sinner@csd4.csd.uwm.edu
Message-ID: <13345@uwm.edu>
Source record: 230973

When running gcc-cc1p.ttp (version 1.35) from g++.ttp (v. 1.35)
with the following command line:

g++ -v -S test-hel.cc -Id:\usr\lib

I get a bus error.

I have a 520 ST upgraded to 2.5 megs.
The file test-hel.cc came with the distribution that I got from atari.archive.

Is the problem not enough RAM (I have over 2 million bytes free)?

(I am compiling from gulam, by the way.)

Any help will be appreciated.

ken

sinner@csd4.csd.uwm.edu

P.S. Does anyone out there actually have g++ up and running?

I'm responding to the following message:
From: steve@thelake.mn.org (Steve Yelvington)
Please keep the juvenile user war crap in Cleveland, and off Usenet.
It serves no purpose related to comp.sys.atari.st.

This has nothing to do with Cleveland. You would have to be a juvenile user
to think it did.

This has to do with spreading around false rumors by people to scare Atari
computer users into leaving their computer.
I think it is wrong so I said something about it.

Ok?

642. Atari.archive monthly posting

Newsgroup: comp.sys.atari.st
Date: 1991-06-23 20:06:21 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Jun23.200621.13642@terminator.cc.umich.edu>
Source record: 230979

Welcome to atari.archive.umich.edu

This is the monthly posting from the umich atari posse. We hope
it will answer some of those nagging questions that always seem to pop up
from time to time. If you have any additional suggestions, please mail
them to me, at weiner@atari.archive.umich.edu.

1: How do I use BART?
Now that BART is back on-line again, you can get bart help by mailing
atari@atari.archive.umich.edu and include the word 'help' in the body of
the message. This doesn't mean you have to send mail Jon or I.

2: How can I connect via FTP?
If you are interested in ftp, I recently wrote a beginner's guide. Please
mail me and I will send you a copy. I'll post it every once in a while too.

3: What if my machine doesn't support name service?
Two things to do here:1) Demand that your sys-admin install it soon,
and 2) use the internet address 141.211.164.8

4: I can't download because my hard drive doesn't work and my modem goes
out sometimes and .....HELP!!!
Sorry, outside of the archive I really can't help you....Your best bet is
to find someone at your site with a similar set-up, or post to c.s.a.st
for advice.

5: What are all the ???s in your index?
The ??? symbol means that I have no clue what this file is. If you know
please drop me a note, but be sure to include what directory the file
is in, etc. Thanks.

6: When I try to FTP to the archive's host, I get a message saying that my
machine wasn't recognized and I wasn't allowed to log in. What's up?
We only accept ftp logins from recognized hosts. If you are not allowed
to log in, please try again. It is possible that the DNS took a bit too
long. If you are still denied access, ask your sys-admin to fix your
name servers.

7: Here's a question for you Jeff, how come I can't use 'ftp terminator.cc.etc'
any more to connect?
That's because you're not using atari.archive.umich.edu like we told you
to. In the near future, terminator.cc.umich.edu will change it's name.
Don't say we didn't warn you.......

There are a few files you'll really like to have:

archivers/arc602.arc : The latest version of arc
archivers/zoo.arc : The classic archive program
archivers/compress.zoo : Useful for removing .Z from sounds and binaries
archivers/unlzh11.arc : Unpacks .lzh files
archivers/sttar.arc : Removes those nasty .tar extenders
THEY ARE CONTAINED IN THE SELF EXTRACTING ARCHIVE starter.tos!!! PLEASE USE IT!

Thanks to everyone who has uploaded anything lately.....

Interesting things this month:

1. Graham Higgins just re-did the gnustuff directory, so have a ball with it. If you get the chance, tell him how much you love it.

2. I've been working on the applications directory, and it should be done soon. I hope things are easier to find?

3. Anyone interested in having an IRC conference to talk about the archive and any things they'd like to see, please mail me.

BART PROBLEMS:
Common Error for the month of June: Bart will send files over 400k, but you must request them by parts.

PLEASE NOTE: FTP service is a privelege, not a right! Please make a supreme effort to keep heavy FTP use in off-time hours (i.e. after 5 pm EST but before 8 am EST), or else you will be shot. (We mean it).

Any ideas, questions, comments, etc. to me,
weiner@atari.archive.umich.edu

Jeff Weiner --- weiner@{engin, atari.archive}.umich.edu

643. Uploading, or how to in three easy steps

Newsgroup: comp.sys.atari.st
Date: 1991-06-23 20:08:30 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Jun23.200830.13733@terminator.cc.umich.edu>
Source record: 230981

```
Uploading to Atari.archive.umich.edu
and
Posting to comp.{binaries,sources}.atari.st
By Jeff Weiner, Atari.archive Papal Figurehead

How to upload to atari.archive.umich.edu:

There are two main ways to upload to the archive: FTP or mail

1: FTP - This is the preferred method, as it doesn't clog my mailbox with
megs and megs of stuff, not to mention it's a bit easier for you too.
Logon to the archive as usual, then issue the following commands

cd ~atari/new
type binary
put filename.ext
mail weiner@atari.archive.umich.edu .... "Hey Jeff, I just uploaded this..."

This last step is very important. As we're now integrating the
index with text and the ls -lR listing, descriptions and an address to
send questions to are key.

Ed Krimen, ekrimen@ecst.csuchico.edu, adds this:

For those that may not know, may I add that, for aesthetic effects,
if you enter "hash," before you "put filename.ext" or "get
filename.ext," the ftp program will display a # for every 1024 bytes
sent or received. Actually, when you 'put' a file, it will display
bunch of # at once. Moreover, if you enter "bell," it will sound your
system bell when a function has completed. Finally, you can send and
receive a list of files using the "mput" and "mget" commands,
respectively, with a list of the files after the command.

2: MAIL - This is a bit slower for you and for me, but is still very effective.
Simply uuencode the file, (please split it into parts ~=60 K or less please)
and mail the result to weiner@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpfull as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled file transmission, containing a short description of
the file, etc. Shar files are also acceptable, but I prefer the uuencoded.

And for those of you who would like to see your binaries and sources appear
in comp.{binaries,sources}.atari.st, the following is taken from Steve
Grimm's Introduction to Binaries and Sources:

Subject: Submitting binaries for publication
```

Items intended for posting or queries and problem notes should be sent to atari-binaries@twitterpatter.eng.sun.com. If you are on a UUCP-only site, you can send them to {backbone}!sun!twitterpatter.eng!atari-binaries.

If you want verification of arrival, so say in a cover note, or at the beginning of your submission, if it is small. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while.

Also, as of volume 8, I will only accept binaries packed with an archiver for which source code is widely available. For the time being, this pretty much means arc, zoo, and lharc. If you want to use a nifty new archiver, make the source code available to the public (posting to comp.sources.atari.st is fine.) I reserve the right to repack binaries with another archiver if the other archiver saves a significant amount of space, or has other advantages.

If you're submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. The net gods become angry when people try to use the net as a free advertising medium, and I'd like to keep comp.binaries.atari.st out of trouble. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. In other words, treat the net like a PBS station (apologies to those outside the US.) I will not accept programs which I feel are excessively commercial. I'm aware that commercial demos and shareware are often very useful (to the users on the net,) which is why I allow them at all.

Subject: Submitting source for publication

Items intended for posting or queries and problem notes should be sent to atari-sources@twitterpatter.eng.sun.com. If you are on a UUCP-only site, you can send them to sun!twitterpatter.eng!atari-sources.

If you want verification of arrival, so say in a cover note, or at the beginning of your submission, if it is small. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, source without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

I prefer that you submit sources and binaries separately, as it's a pain to separate them, and such submissions are invariably placed on the back burner. Sources should be submitted in the same format as binaries -- uuencoded arc, zoo, or lzh files. Please use Pierre Dumas'

"uue" program if possible, as it can correct some common transmission errors. Split long submissions up into reasonable (less than 50K) chunks. "uue" will do this for you, if you use "uue -700 file" to encode.

Please inform me of any special system requirements, and what development environment was used, so that I can properly test your submission and label it when I post it.

644. FTP Beginner's Guide

Newsgroup: comp.sys.atari.st
Date: 1991-06-23 20:10:55 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Jun23.201055.13823@terminator.cc.umich.edu>
Source record: 230980

This is a basic guide to ftp. It is intended only to get you on your
way to ftp happiness. Please let me know if you have any comments,
questions, or suggestions.

weiner@atari.archive.umich.edu

~~~~~~
Jeff Weiner's FTP Basics Vol.1 #1

Part 1: Logging in
To begin an ftp session, the first thing you need to do is log in to our
machine. You can do this by issuing the 'ftp atari.archive.umich.edu'
command. You should then see something like this:

Connected to atari.archive.umich.edu.
220 atari.archive.umich.edu FTP server (Version 4.169 Wed Jan 2 17:03:56 EST 199
1) ready.
Name (yourhost.domain.edu:yourusername):

At this prompt you'll want to type 'anonymous'. On some hosts, the word
'guest' will work, but 'anonymous' is always a sure bet.

If you don't see this login prompt, but instead get something like
'Our host was unable to trace a name back to (some internet address).
We only accept ftp from properly registered hosts', then you'll have to
ask your sys-admin to properly register your machine in its name servers.
There's nothing we can do on this end, so please don't bother asking.
Also, if your machine doesn't allow you to specify the atari.archive name,
try using out internet address : 141.211.164.8 Then, march down to
your sys-admins office and ask him to install name-service. Your life will
become much easier.

Assuming you recieved the above prompt, you'll then be asked for a
password. Use your mail address. For example, I would use
'weiner@atari.archive.umich.edu'

Part 2: Basic Commands
Once you're logged on, there's a few basic commands you'll want to know about.

ls : lists the names of files of sub-directories in a directory.
ls -C : Lists the files horizontally, instead of vertically.
ls -F : Lists filenames, but adds a / to the end of directory names.
dir : does the same thing as ls, but is needed on some other machines
ls -l : A verbose listing of files. Includes permissions, filesize, etc.
cd : changes directories (i.e. 'cd atari' would put you in the atari area)
cd .. : Goes 'back up' a directory, to the one you came from.
~~~~~~

This from redmond@IUS4.IUS.CS.CMU.EDU:
For more than one argument to ls, use double quotes. Eg. ls "-FC *.lzh"

These are about all you need to get moving around the archive.

Part 3: Getting the Goddies

The main reason you want to ftp in the first place is to quickly transfer files. More often than not, you'll want to transfer the files from the archive to your account. You can do this using the following commands:

First, find the file you want to download.
Second, issue the command 'type binary'. This tells our machine that you'll be transferring a binary file. This is really important. You'll waste a LOT of time if you download files that were not transferred in binary mode.
Third, issue this command 'get <filename.ext>'. This will instruct the archive host to send <filename.ext> to your account.

The last thing you'll want to do is use the 'quit' command. This tells our machine you're no longer interested in ftping files, and would like to go back to your command prompt.

Now, you'll need to download your files from your mainframe(sparc, whatever) to your ST. Usually you'll want to use either kermit or x- or y- or z-modem protocals. They're very reliable. I'd be quite hesitant to try something else. Also, your machine and ST are usually unique to you. This means that I really can't help you with this part. You could try asking, but I'm going to promise anything.

Part 4: A Few Words on Net Ettiquette

Net Ettiquette is something that every net user should be aware of. Relating to ftp, and our archive, it is essentially this:

1) Try to keep ftp usage to an absolute minimum during business hours, in our time zone. That would be 9 am to 5 pm , EST. This roughly means upload or download one file or so and little else during these hours. After 5pm, have a blast. Go nuts. We probably won't mind nearly as much..... Otherwise, we will drive to your campus or place of work (even if you live in Europe) and we'll kick youe butt. Or, Jon will sing Prince songs to you. Whichever you'd like the least.

2) If you have a question about some aspect of ftp service or some other area of your computer, please ask around at your site first. Don't immediately fire off all of your questions to us. I don't mind answering questions about the archive, problems with logging in, or something similar. But I tend to get upset when people ask me questions like, "Jeff, how come I can't get the fgrep command to work properly on my sparc station...."

3) Please try to upload files that you know the archive doesn't have. I know it's not the greatest thing to do, but if you can find time to download stuff, I think you can find time to return the favor and upload things also.

If you have any reasonable questions, any comments or concerns, etc.
please mail them to me, weiner@atari.archive.umich.edu.

Thanks,
weiner

>
Don't know much about MIDI, but I've never heard of Ami having any kind of
timing problems. I know the Dr. T's software has been moved to the Amiga;
other MIDI sw I know of includes MusicX, Bars & Pipes, & B&P pro.

>> On the other hand, Amiga sales are higher than ever.
>
>Bzzzt! Commodore just posted its worst figures in 4 years.

Funny, the last stockholders' report got from CBM indicated that 1Q &
2Q 91 were among its best quarters ever. Something like a 50% increase in
unit sales in Europe alone? Outsold IBM in Britain last year? CDTV &
Video Toaster recieving good press all over the US? Selling so many A3000's
via the Power Up Program that they're back ordered for weeks?
Please name your sources for the above comments.

Guys, I have always kept my fingers FAR far far far from the followup keys when reading articles such as this... but I will finally make a post and don't lecture me about wasting bandwidth-- take THAT to IRC.

Anyway, my ST does what I need a computer to do. Most people don't have the money nor the need to get a super home computer. For years now I have had people ask me about which personal computer to purchase. I tell them that if they go into a Macintosh dealer, they will probably be told that the Mac is the answer to life and all their problems. If they go to an IBM dealer, they will probably be told that the IBM (or clone) is the answer to life and all their problems. The same is true of an Atari dealer and an Amiga and any other dealer. It's called sales.

My opinion is that if you are in the market for a computer, you really need to decide what you are going to be doing on that computer. You must then do a little research into what is available that will meet your needs and then you should find a platform that will provide what you need.

It never ceases to amaze me how much sales people try to oversell a system. I love to listen to IBM (or clone) salespeople explaining all the display options and cpu speeds to someone who wouldn't know a MHz from a pixel.

MY atari does what I need it to do. I'm 100% positive that YOUR Amiga also would do what I would want it to do. Now, since I have an Atari and it does what I want, I am not going to purchase a Sun SLC, Amiga 3000 nor any other computer that will mean that I need to spend thousands of additional dollars for very little gain. for people who do not yeat have a lot of money invested, there might just be some room for comparison, but it's never necessary to lie to try to get people to do anything.

As far as people thinking "the computer makes the man" (or the woman), well, I certainly don't mind if people keep selling their Atari products to switch over to Amiga.... because I will have a continuous supply of inexpensive used equipment.

Reminds me of how I got my great set of gold clubs.... It seems that the "IN" thing to do if you are rich and play golf is to purchase a snew set of clubs every year. Hmm, guess what happens to the old clubs? Yup, many times they are given to charity or other groups. that is what this whole "mine is better than yours" argument reminds me of-- I simply say I am happy and satisfied with what I have invested in and I will make up my own mind if and when there is a time to move on.

Unfortunately, not everyone is a computer hobbyist as I am and so they may be presented with "this is better than that" arguments from whereever they go to purchase or investigate a computer and may be persuaded to follow a path they may not have intended to follow. To me, this is the root of the problem, if people would purchase what they need and not what other people tell them that they need, I feel more people will be satisfied with what they end up with. Perhaps then even less attention will be paid to this topic than is given to it now.

Thank you for allowing me to finally express my opinion and I hope no one will take this post as an argument or "flame" for or against anyone or any computer. If I must directly state my point, it is that I feel that people should be allowed to make up their own mind and do as they wish and it is unnecessary to work on someone's will and resolve simply because you feel they may have made a bad choice.

Scott

Hi Thomas (Darling),
Your comments to Thomas (Hill) hit the mark quite well...

"Tom, I haven't read such a heap of bunk it a long time. If you're frustrated that your computer isn't being used in any professional environment, fine. But don't come over here and shovel propaganda and outright false statements in an effort to get others to join you in your malcontence. Grow up. A "my computer is better" rant under any other name smells equally bad, no matter how you may attempt to dress it up."

A bit of humor.....

"You noble soul! The self-sacrifice! In turn, I offer to help YOU smooth the conversion of your lips from their present location to my sweaty posterior. I do this as a service!"

Where does he get those wonderful lines?! =^) Thanks for saying what many of the rest of us would not have bothered to say. Bye.....

Luis

650. Thomas Hill

Newsgroup: comp.sys.atari.st
Date: 1991-06-24 01:48:52 UTC
From: revpk@cellar.UUCP
Message-ID: <68V141w164w@cellar.UUCP>
Source record: 230990

I don't post or read this echo very often-- most of the subjects are a little outside of my interests-- but I couldn't help but notice Thomas Hill's notes about the ST and Amiga.

On local boards, I've grown very tired of the computer wars. Not just because it's a pretty senseless topic to argue about to begin with, but because the only way anyone is remotely justified in claiming superiority for his computer is if he BUILT and DESIGNED the damn thing himself. But 99.9% of us can lay claim to having the cash, credit cards, or wealthy parents that enable us to make a purchase-- at BEST.

And, because I'm an open-minded sort, I don't bust on other peoples' purchases; for one thing, we don't argue over what brand of CD players we buy, and another, different strokes for different folks.

Now, Thomas Hill's endless touting of the Amiga struck me as more than a little strange. Not because some of his facts might be wrong, or because he was presuming to know things about the ST marketplace that we didn't.

But think about this; Thomas Hill goes out of his way to bust on ST users, and wants to convince us to use Amigas. Granted, they're nice machines-- my roommate just bought a 3000-- but why is Thomas Hill so messianic about them?

I can understand, halfway, if Thomas had found Jesus or had submitted to the will of Allah, and wanted us to do the same. But why is Thomas so wrapped up in what computers we own? Is he an Amiga salesperson? A Commodore marketing manager? Why, exactly, is he so emotionally committed to making sure that we own HIS kind of machine? Does owning an ST constitute a moral affront to him?

Issues of STs and Amigas aside, I think it's pretty clear that Thomas has some problems. Not even the do-or-die Commodore 64 fans I know-- mainly children with few other interests to hold their allegiances-- get as worked up as THomas does. I can think of a dozen better causes for Thomas to worry about-- say, supporting the Electronic Freedom Foundation, or better, using his fables Amiga to crank out letters on behalf of Amnesty International.

In short: what sort of deranged, socially-deprived noodnik would give a tinker's dam about what computer anyone else uses-- and would actively campaign to sell merchandise that he has no immediate financial stake in? Heck, I've seen more rational stuff coming out of Jesus freaks.

>This week's program will copy a file that has a bad sector(s) somewhere in the
>file. This archive includes docs and the program.

Sounds useful.

>100% assembly

^ Oh. In that case, I will not use it.

Why does an IO program need to use assembly?

I think the most required attribute for an IO program would be:

Correctness (ie. Stuff-up-my-files-and-I'll-kill-you)

While the least required attribute would be:

Efficiency

Since the program will spend 99% of it's time waiting for the disk anyway.
Using the assembly instruction

move.IO #"A:file","B:file"

which, as you know, copies two files in one clock cycle, then waits for
the disk to catch up, would only speed up the process by 1%.

Don't get me wrong, I use assembly a lot. But only for speed critical routines
that have obvious correctness (eg. Sprite works / Sprite doesn't work).

Ciao,
Warwick.

I had NO intention of getting into this thread. I thought
I'd read it for the humor content. BUT, you are totally wrong,
and that shouldn't stand.
Commodore IS having its best quarters in a very long
time. The Christmas quarter (from Oct. 1 -- Dec. 31, 1990) they
had their 3rd largest sales EVER and earnings were tripled from
the prior year quarter.
The last quarter (Jan. 1 -- Mar. 31, 1991) was also well
above the prior year quarter, with something like a 10% increase
in sales and a large increase in earnings (primarily cause they
were so bad the year before), something like $10 or $11 million.

Hello:

A while ago, I went to use my FLASH program to call the local boards like I always do, but this time; I got a TOS ERROR #35 message and couldn't use this program. Frustrated, I returned to the store I bought this program from, and they said I'd have to send it to the company. So I did... I am now using the VT52 emulator that comes with the USA Laguage disk.

I am sure that when I ask this, some people will no doubt wonder too:

Wbat does the TOS ERROR #35 mean? I looked up the error number, but found it no where in any of the manuals.

Thanks in advance for any replies.

I'm just wondering what our dear friend over in Commie-land (Amiga, not USSR <grin>) would feel if someone were to step into their message base and kindly show them how to convert over from Commodore to the Atari. While this is called a "friendly" thing, for one no one on here asked for this "help." If someone wants help, do it in PRIVATE.
It remins me of something done in wartime and even during Desert Storm: drop tons of propoganda on the enemy telling them step by step how to surrender (many of the Iraqi soldiers who surrendered carried these "information slips").

While I admit it is a stretch comparing this to the war, the point is that the same strategy/technique is being employed.

or in short: I didn't ask, I don't remember seeing ANY postings here about it, and thus we really ain't interested in your "help."
So I kindly ask our noble friend to save his blessings for those who want and need it - in the Commodore section...

end, fine, et al...

Robert Anisko

If you get this error, your program file is corrupted, i.e. TOS does not
recognize it any more as executable. A reason for this is a bad program
header or a fatal error in the relocation table.

Sigh. I don't know why I bother. Maybe I should just unhook
comp.sys.atari.st and rely on GEnie, where they pay people to spike
ruggie user fight trash.

You and the ill-mannered Amiga fanatic from Cleveland Freenet are
engaging in a public pissing match, posting lists of messages from
Freenet's Commodore forums and recycling ignorant, inflammatory,
ill-intended messages.

It is noise. It drives reasonable people of good will away from the
newsgroup. It has no place here. If you think you're doing Atari
owners or c.s.a.st readers a favor, you're mistaken.

```
High Density 1.44 MB disk on TT and MEGA STE
""""""""""""""""""""""""""""""""""""""""""""

In the TT 3.05 and MEGA STE 2.05 TOS version there are in addition
to "SINGLE SIDED" and "DOUBLE SIDED" a format option for
"HIGH DENSITY" in the resource file in ROM. This is removed in
the dialog box for format, but can be turned on my flipping over
one of the DIP-switches inside the computer. And if you put a
HD-drive inside a TT it actually works (we have testet it).

The big question is - Is it safe to use HD drive on the TT with
the standard Floppy Disc Controller, AND can I use this on my
MEGA STE too, or should we wait for new controllers from Atari
(will they arrive soon - come on Atari - what about some info?)

I want to install the gcc, g++ binaries on my atari but I am a bit
confused what programs I need. When I look at the gnustuff at a.a
I will find archives with names in it that cannot be used in a Atari
with TOS file system (to long, to many points in it)

So could anyone tell me how to setup my system so I can use the gnustuff
and what files to download from a.a?
I have a 1040STf with TOS 1.0, 1 Mb and enough diskspace or
a Mega 4 with TOS 1.4 and enough diskspace

I do not want to have the sources just the binaries

Harold van Aalderen (hvaalde@cs.vu.nl)

P.S. does anyone now an other C++ compiler for the atari ST?

> they've got now, they never will be.

Oh boy, this was a design problem in the first MIDI software on the Amiga,
has nothing to do with anything Commodore is responsible for, and hasn't
been a *real* problem for years. We've run heavy MIDI streams through multi-
program pipes, the MIDI clock on the Amiga (using the CIA timers) never
skipped a beat, and CPU usage sat at 9%...

Well then, it's good that the Amiga 500 costs $500.

> For years now I have had people ask me about which personal computer to
> purchase.

Amiga. I pushed the machine before I ever got one. I put off buying a personal computer for 6 years waiting for something like the Amiga to come out. There is still, 6 years later, *NO* other personal computer with an operating system that satisfies my *minimum* functionality requirements, unless you go out and buy a UNIX box.

And at that it's one of the cheapest machines out there.

> MY atari does what I need it to do.

You're satisfied, but have you used a real computer?

I've been there. I borrowed an IBM clone for a while, then an Atari ST. It's called shopping around. The productivity improvement from reliable, efficient, and responsive multitasking is amazing.

There really is a basic, fundamental difference between the Amiga and the rest. Your arguments make good sense when comparing Ataris and Mac and IBMs, but there *is* something better.

And *you* don't have to wait 6 years to find it, like I did.

>HD-drive inside a TT it actually works (we have testet it).

HD drives can be used with TOS 3.01, too. The only problem is that you
cannot select the "HIGH DENSITY" option because of a bug in TOS. So you
have to format your HD discs in another way.

>The big question is - Is it safe to use HD drive on the TT with
>the standard Floppy Disc Controller, AND can I use this on my
>MEGA STE too, or should we wait for new controllers from Atari
>(will they arrive soon - come on Atari - what about some info?)

I have worked with the TT and HD drives for a few months now. There are no
major problems but my controller does not like the 16 MHz used for reading/
writing HD discs. When the controller warms up I cannot use HD discs any more.
So it depends on the controller if you are able to use HD drives without
waiting for a new controller chip.

An American buying software from UK won't have much trouble as you say.
Given the same TOS, the difference is only a few keyboard assignments (
@,~,# or something like it). The situation is much better than getting
software from other part of Europe: the keyboards are very different!
But if you don't hit a key, the program should run without a hitch.

One thing worthy to note: when UK vendors export, they cannot charge the
notorious 17 per cent Value Added Tax. And 17 per cent is usually cheaper
than the air mail parcel post cost.

Cheers,
Tsuji

Actually, it appears that Tom (the original poster of the 'informational'
message, which I never actually read but heard a little about) did so
specifically to start a flamefest in c.s.a.st. My evidence for this is his
post from a day or so ago in c.s.amiga.advocacy inviting everyone to move
over to c.s.a.st and join in the fun....
The best way, of course, to alleviate this problem is to just ignore it &
let it die out when people realize they're not getting the attention they covet;
we know, though, that that's not likely to happen.

Message-ID: <9106241658.AA08274@cwns10.INS.CWRU.Edu>
Source record: 230914

After downloading almost every mod file player that the Atari archive has, I have yet to find one that lets me use my hard drive to load in the lengthy mod files.

The Audio Sculpture program is a work of art, and so is the Digi-Composer program. Both allow me to use the ST Replay cartridge for one speaker, and the monitor for the other, allowing true stereo from my ST! The problem is, the sculpture program can only (as far as I can tell) be loaded from a floppy drive, and doesn't allow the hard drive boot program to load. (It is a boot disk) The Digi-Composer gave a little more hope, since it runs from GEM, and after the hard drive has been installed.

The problem is, it won't allow hard drive use either, as far as I know. I set the preferences to save preferences to drive C, the modules to C, and the samples to C. I didn't have any problem understanding this, but when I click on save preferences it gives me four bombs, or else it clears half the screen and then another fourth, and then locks up. It does a similar thing when I try to load MOD files from the hard drive C partition.

I found the program Replay 1.5 MOD file player in the noiztrkr.lzh file on the a.a., but this doesn't allow stereo output, but it does let you use the hard drive.

Any ideas on how I might get this to work, or maybe an update on the replay mod file player that allows stero output? Any help would be greatly appriciated.

Thanks in advance.
.

What do you define as a REAL COMPUTER? As an ex-AMIGA user, I only
knew the AMIGA as more of a game machine than a serious business machine,
the ST was known for the business applications. For me the ATARI systems
are more of a real machine than any AMIGA systems.

I wonder how far have you gone in comparing AMIGA machines to others,
AMIGA Fusion Forty Accelerator board is worse than a 486-25 Performance.
AMIGA flickers quite alot, NTSC standard VGA cards are available to IBM
with non-flicker options.

Exactly. The chip isn't ready yet, and that's why the current Mega STEs
and TTs have socketed FDCs. It is also the reason why Atari didn't
comment officially on the new capabilities of our favorite computer.

>a better program?
>
>Matt Asplund
>BYU
>Provo UT

As far as I am aware, ALL reset proof ramdisks involve a RESET if
they are resized. In this EDISK is no exception.

However the main point of this reply is to draw your attention to
Mark Williams Co.'s RDY ramdisk utility that is now PUBLIC DOMAIN - even if
you are not a registered licensee of Mark Williams "C". This is FAR more
sophisticated than EDISK (I am familiar with both!) - in that it allows
you to configure Reset-Proof ramdisks that are Booting or non-booting and
you can simultaneously load as many ramdisks as memory and/or volume letters
(C:\,D:\,....P:\) allow. You may also configure the ramdisk to have the FAT
structure of a FLOPPY so you can SECTOR-copy the entire contents of floppies
quickly onto them (using DFT.PRG - a program within DFSUITE2 - also available
on the network) - or you may use 16-bit FATS for additional access speed.
Further they may be saved WITH CONTENTS to .PRG files on floppy or hard
disks and loaded again with ease by simply executing them.

As Mark Williams reputedly no longer write software for the ST, there
was a hiccup when I tried to use my old RDY installations on a new STE. I
looked into the problem, to discover it was to do with the RESET VECTOR not
being correct for the STE. A minor hack produced RDE.PRG - the STE-compatible
version of Mark Williams' RDY.PRG - which, with Mark Williams Co.'s
permission, was distributed on atari.binaries.st last January or early
February. This has solved similar problems for many who recently "upgraded"
to an STE - as is testified by the many Emails I've received.

One further advantage is that saved RDY ".PRG" files may be packed
with an efficient packer (like PFXPAK - also PUBLIC DOMAIN) that makes them
extremely economical to store on Floppy. Working this way with a 4-Mbyte STE
I can load many different utilities on different ramdisks simultaneously and
have not so far felt the need for expensive error-prone hard-disks.

Anyway, hope this may help some readers.

W. Alan B. Evans
[wabe@ukc.ac.uk]

P.S.: Whilst EDISK is not as sophisticated as RDY/RDE, it is excellent as a SINGLE reset proof ramdisk. It works equally well on the new TOS as well as the older versions - which means it "looks up" the proper RESET VECTOR, *((long *)0x4), in Supervisor Mode before executing it - which was the fault with RDY (or at least the version of RDY I was given when I upgraded to Mark Williams "C" version_3.0.6). When I upgraded I never was given the sourcecode of this "newer" RDY that worked satisfactorily on 4Mb machines (presumably there was insufficient space on the upgrade disk) - so I would be obliged if anyone who bought version 3.++ of Mark Williams "C" and who presumably got this "updated sourcecode" - which is now also PUBLIC DOMAIN (or so I learn from a FAX from Mark Wms' Dale Schumacher - but I don't really know where to access it) could be bothered to Email me this. True I could probably get it from Mark Wms. Co. also - but, as they've left the ST-scene, let's not bother them. I would then, I believe, be able to modify it so that a single RDY.PRG would work (like EDISK) on all ST machines - the only slight doubt is whether there is enough room in the bootsector of a self-loading RDY ramdisk to include the few bytes of additional code required to "look-up" the reset address vector before using it.

686. What's a STE anyway?

Newsgroup: comp.sys.atari.st
Date: 1991-06-24 19:46:49 UTC
From: freds@hpspdla.spd.HP.COM
Message-ID: <12020005@hpspdla.spd.HP.COM>
Source record: 230927

I have recently started reading this board, so I apologize up
front if this has already been asked:

What is the difference between the MEGA ST and the STE?

Can a MEGA ST be upgraded to the STE? What does Atari have
to say on this subject?

I purchased my MEGA ST when they first were introduced, fortunately,
it died about three months later, so I got a version without a lot of
the first bugs. I've updated TOS since then also.

I have tryed to sell the system, but I have had no real offers. I had
buyers for the monitors, and one piece of software. I guess no one likes
the old MEGAs.

Thanks,

freds@hpspdla.spd.hp.COM

687. Wanted: ZORK for Atari ST

Newsgroup: comp.sys.atari.st
Date: 1991-06-24 20:40:37 UTC
From: trevor@ccc.govt.nz

Aaaaarrrgghh!

I feel like I've woken up (over) a year late - which is what comes of
taking 'established' institutions for granted.

So, is there anyone out there willing to sell me a 2nd-hand copy of
Infocom ZORK (& maybe Lurking Horror, MIT games are folklore-ish too),
to run on an Atari ST ?

I'm about to be a little preoccupied, so I may be a little late dealing
with my post, but I would like to buy these programs.

Thanks in advance.

darling@cellar.UUCP (Darling) writes:

%ai065@cleveland.Freenet.Edu (Thomas Hill) writes:

> Even Atari's best feature,
> good MIDI software, is weakening as several of those authors port their
> software to the Amiga.

%Ever met a professional producer, Tom? We use the best programs available on
%any computer: C-Lab's CREATOR/NOTATOR for sequencing, Digidesign's ATARI
%SOUND TOOLS for digital audio recording/editing, and POLYFRAME for patch
%editing. None, I repeat, NONE of these have been ported to the Amiga. And
%unless future Amiga machines clean up the severe MIDI timing problems they've
%got now, they never will be.

In all my reading and experience with the Amiga, I have yet to hear one complaint about "severe MIDI timing problems". Care to back that up with some source material? Also, please re-read what I just wrote, as you seem to have taken it out of context. "Even Atari's best feature, good MIDI software, is weakening as several of those authors port their software to the Amiga." Did I mention any of the above titles? The answer is no, but I can promise you that I always deal in facts. After all, facts are what made me pick the Amiga over the ST and any other computer in it's price range. Here are a few quotes from the January 1991 issue of Amiga User International-

"In 1985 Steinberg introduced an Atari sequencer called the Pro24. It was good, well ahead of it's time in some respects, and tt's dit rapidly gained professional acceptance."

"The fact that Steinberg have released a Pro24 version on the Amiga is significant in several respects not least in that it indicates that Steinberg are now prepared to take the Commodore Amiga music market seriously. Make no mistake...the Amiga, from a technical viewpoint, can run rings around the ST but because of the lack of music software many musicians had, until fairly recently, been wondering whether professionally useable packages would ever arrive."

"The Amiga version of the Pro24 is not a direct port of the original program-it's a complete re-write. The aim was nevertheless to produce an enhanced look-a-like, as opposed to an identical one, and this is something which has clearly been achieved."

"With Pro24 Amiga all of this is taken one stage further because the program runs in the standard multi-tasking environment. Whereas machines like the ST are struggling to provide the sort of environment in which several programs can run simultaneously..."

It goes on to say many nice things about the program. Anyway, beyond this there are several other Atari software vendors ported their MIDI software to the Amiga. Some of these (even titles you mentioned) are still in the rumor stage.

> On the other hand, Amiga sales are higher than ever.

%Bzzzt! Commodore just posted its worst figures in 4 years.

Oh really? I'd love to hear where you got that information. I can post recent figures from the source that say we've just had one of the best years. Care for them?

> If you need any advice on file conversion,
> where to buy Amiga-related hardware for the best price, information on the
> Atari ST emulators out for the Amiga, or have any other questions related to

%I'll save you the time, Tom. Amiga ST emulators blow. They're all slow, %buggy, and none, I say again NONE, work properly with any MIDI software %whatsoever. Makes ME want to rush out and buy one, so I can play 32-million-%coloured games instead of all that WORK I'm getting done now.

As typed in from the Feb issue of Amiga World, page 109:

BrainSTorm

It had to happen and here it is! The MAST ATARI Emulator!

Make your Atari friends envious - now your Amiga emulates yet another computer, this time the Atari. BrainSTorm is a software/hardware combination from MAST Germany that runs 98% of Atari software (approx.), including MIDI support. It even emulates the Atari keyboard click! All programs should run except the very small percentage that do direct DMA or program the MFP. It supports:

* 8mb Fast RAM, 2mb chip ram
* all ST resolutions including color
* full page monitor emulation with scrolling
* Amiga serial & parallel ports
* all Amiga drives (df0-df3) simultaneously
* two ST's at same time in one Amiga!
* almost ST speed, text is 120% faster, disk 108%
* hardware emulates the ST custom chips, has sockets for Atari ROMS, and does addr. translation
* Atari PD support on our BBS

Price is $99

Call MAST at (702) 359-0444

[END OF FILE]

Other ST emulators, some in total software, exist for the Amiga also.

> I have received several requests for
> information to smooth the conversion from the Atari to the Amiga. I do this
as
> a service to fellow computer users.

%You noble soul! The self-sacrifice! In turn, I offer to help YOU smooth the
%conversion of your lips from their present location to my sweaty posterior.
%I do this as a service!

This kind of talk leads nowhere and isn't productive to the conversation. If
you want to talk facts then I suggest you stay on the topic. I won't respond
to such remarks as they have nothing to do with the exchange of facts. Please
try to do the same.

%Tom, I haven't read such a heap of bunk it a long time. If you're frustrated
%that your computer isn't being used in any professional environment, fine.
%But don't come over here and shovel propaganda and outright false statements
%in an effort to get others to join you in your malcontence. Grow up. A "my
%computer is better" rant under any other name smells equally bad, no matter
%how you may attempt to dress it up.

You insult me and then tell me to grow up? I am willing to ignore attacks by
insecure users in order to help those who need the kind of information I am
providing. So far I have received mail from well over ten Atari users who
need help in converting to the Amiga. This makes it worth cutting through your
kind of message. If your not interested in leaving your ST for the Amiga then
I'm glad to hear it, but don't make things rough for those who want to.

Tom

>with non-flicker options.
>
The first point you make isn't a computer war, but a chip war. The 040 is faster than the 486 at the same clock speed, period. A 486/50 is probably marginally faster than the 040 (except under MS-DOS), but it is still close. The 040 25MHz does appr. 18-22 MIPS depending on who you believe (I know how meaningless that is, but we are talking all CISC chips, not RISC, so isn't a terrible statistic). I believe the 486 is about 12.
As to flicker, the A3000 comes with a flicker-fixer built in. Commodore sells a board for just over $200 which will deinterlace output on all 2000 machines. Both use standard IBM VGA ports. There is a 3rd party deinterlacer for the 500 as well.

Hi Marc,
Just a note about DigiComposer. I believe that DigiComposer
has a .INF or .DAT file that contains directory paths for the program. You
load this file into any word processor or text editor and edit the directory
paths to match where DigiComposer (and the .MOD files) are located on your
hard drive; then save the information back as an ASCII text file. Bye.....

Luis

I wasnt going to jump in, but I am a dickhead, so what the hell :-)

Cease and desist!!! If I want Amiga stuff, Ill read the Amiga newsgroups, as it is, Ive gotten an Atari ST a few months ago, so Ill read this group. Ive used both Amiga, and now the Atari, Ive used Macs, and Ive used IBM Clones. Ive used Unix, and IBM large systems (370s, and 4381), and midrange VAX (my own personal 730, and the 6220 at work). I pledge loyally to _no_ machine. I got burned years back, and now I wont do the same thing again. Each machine is good, and each machine has its bad points. (correction: I _do_ pledge loyalty to VAX and its OS, VMS. Aint no way such a huge base aint gonna disappear overnight). Each does its job as well as it can, if it cant, then go out and get what can. Me? Im a hacker in the old-time sense, and the ST is perfect for me

revpk@cellar.UUCP (Brian 'Rev P-K' Siano) writes:

% Now, Thomas Hill's endless touting of the Amiga struck me as more
%than a little strange. Not because some of his facts might be wrong, or
%because he was presuming to know things about the ST marketplace that we
%didn't.

Please be specific about what I was wrong about. Like I've said before, I
don't make a statement unless I have the facts and figures to back it up.

% But think about this; Thomas Hill goes out of his way to bust on ST
%users, and wants to convince us to use Amigas. Granted, they're nice
%machines-- my roommate just bought a 3000-- but why is Thomas Hill so
%messianic about them?

I don't "bust on" ST users. I never get into needless remarks and childish
statements. Presenting the facts and offering ST users help is not what I call
"busting" on ST users.

% I can understand, halfway, if Thomas had found Jesus or had submitted
%to the will of Allah, and wanted us to do the same. But why is Thomas so
%wrapped up in what computers we own? Is he an Amiga salesperson? A Commodore
%marketing manager? Why, exactly, is he so emotionally committed to making
%sure that we own HIS kind of machine? Does owning an ST constitute a moral
%affront to him?

I'm not an Amiga salesperson (though I'd love to be), but I am hoping to help
those who buy computers based on no facts.

% Issues of STs and Amigas aside, I think it's pretty clear that Thomas
%has some problems. Not even the do-or-die Commodore 64 fans I know-- mainly
%children with few other interests to hold their allegiances-- get as worked
%up as THomas does. I can think of a dozen better causes for Thomas to worry
%about-- say, supporting the Electronic Freedom Foundation, or better, using
%his fables Amiga to crank out letters on behalf of Amnesty International.

"Worked up"? Pardon me, but where in my message do I get "worked up". I pride
myself on staying away form this kind of thing.

% In short: what sort of deranged, socially-deprived noodnik would give
%a tinker's dam about what computer anyone else uses-- and would actively
%campaign to sell merchandise that he has no immediate financial stake in?
%Heck, I've seen more rational stuff coming out of Jesus freaks.

It always works out this way. When a person can not support his end of the
conversation (this is about computers, not egos) he will resort to attacking
the personality of the person he is dealing with. I don't need to call you

names to support my argumentation. Please try to do the same.

There were a bunch of them back when Deluxe Music Construction Set and
SoundScape first came out. It seems they did a poor job of handling timing
and some folks interpreted that as being an Amiga problem.

Like when the first TOS ROM upgrade came out and broke a bunch of poorly
written terminal emulators. Or when the first >1M Macs came out and
Microsoft's software started breaking. Or the TSR WARS on the IBM-PC.

Computers are always getting bad reps from application software.

lch3e@holmes.acc.Virginia.EDU (Lauren C. Howard) says:
> Atari Germany canceled their advance order of 10-15,000 units under
> pressure of German developers, WP contacted Atari in Sunnyvale. Reports
> vary somewhat, but the result of that talk seems to be that Atari Corp
> will not at this time back WordPerfect by assuring a minimum order.
>
This is simply not true. Atari Germany has TONS of unsold 4.1 versions.
They asked WP for a beta test or preview version of 5.x, but WordPerfect
wasn't able to show something -- would YOU have ordered 10000 units of
a program you don't know, having lots of unsold copies of an older
program version that virtually no one buys.

Please don't blame the `germans'. WP is mainly an american company, and
if they can't succeed in the U.S., they won't in Germany either.

BTW: I would *love* to see a new WP on GEM!

Hi, I have heard stories that there are some lawsuites going on between an ex-employee, Atari, and Greg Pratt and was wondering if someone could tell me in e-mail how serious they are?

I have heard that Greg is a pretty nice guy and was wondering if this law suite would interfere with the leadership at Atari U.S. especially when Atari looked as if they were going to make a move here.

I know someone is going to ask me, "What's it to you??" so I as might as well answer it now. I own an Atari product and the quality of leadership can effect my investment in the future.

|> I'm a bit confused regarding the different formats available for
|> archiving files e.g. arc, lharc, zoo etc. Is any one of these
|> formats more efficient or reliable than the others, if so does
|> this not make the others somewhat redundant? Is there any
|> compatibility between the different formats?

ARC:
Fast, reliable and effective. Since version 6.02 arc can archive complete
directories. Unfortunately it cannot store/extract dedicated files from a
directory :-(.

ZOO:
Not as fast as arc but very reliable. The most flexible archiving system.
You can put several versions of a file into an archive, associate comments
with archive elements and much more. Reading the zoo manual is really
worthwhile! Zoo archives need some more space than others. My favorite
archiver for larger distributions with nested directories. I also use it to
backup my program development directories because I can store several
versions of the source files.

LHARC:
Slow and unreliable. It has become popular because it has the best
compression factor. However, archiving and extracting is really slow. There
are several not always compatible LHarc versions by different authors
floating around. So if you don't have the right LHarc you might not be able
to extract an archive at all. Just say NO.

Message-ID: <1991Jun25.112121.19844@ariel.unm.edu>
Source record: 230945

I'm curious how the 8bit emulator for the Atari Ste/TT
systems works... like, how can you get the programs from
the 8bit to the STe/TT to begin with?
Do you need a 5 1/4" Disk drive for the STe/TT?
Please, e-mail me and let me know!
I'm considering buying a Mega STe/TT030, and then transfering my progams
from my 130xe to the Mega..

I also have heard that a C=64/128 emulator is out for the STe/TT.
Is this True?

Also, how does the IBM 386 Emulator work?
What percent compatable is it?
Can it do VGA/Super VGA graphics?

Does anyone out there have experience with this?
I appreciate any help, as it will help me decide on the STe.

Thanks,
Marc Bluefire

Julian,

WordPerfect is doing fine in the US, just not on ST platforms! It's a real hot
seller in V5.0 for the IBM. I guess the developers don't see enough $$$ in
doing an ST version, and that's that.

If this keeps up, pretty soon, I'm going to have to write all my own
application software 8;(

We've been asked that before... We will perhaps release source code for some of the stuff, but we really aren't sure about it.

As for neat tricks, some of it is voodoo programming, and I'm sure Atari will appreciate if we don't go spreading voodoo programming techniques. Altho, you can always ask us when you are intrigued.

I have a postscript previewer written by Hauke Hess, who has given me permission to upload it to atari archive. It is based on the ghostscript epson driver, so it is a little large and a little slow. Other than that, it is quite nice. You can specify the resolution of the image and then scroll around it with the cursor keys. I hope to include something like it in the GS 2.2 (already released) or 2.3 (soon to be released) port to the ST. The program is called gsprev, and I will send it to atari.archive as soon as I get some time.

>so isn't a terrible statistic). I believe the 486 is about 12.

MFLOPS is a better measure than MIPS, the 68040 25 does about 3.5 MFLOPS, the i486-25 with Weitek 4167 does 10+ MFLOPS and the ranges of MIPS for the 486-25 is from 11 to 15 MIPS.

I am thinking again about building a hard drive for my ST. I have an ancient 10 MB Supradrive in a shoe box case. I was thinking about reusing the case & power supply & tossing a new drive in there.

Can some kind people please send me infomation about any/all of the following questions:

(1) What host adapters are available, where can I get them, how much do they cost, what are the differences?
(2) What drives do people recommend? Where is a good source to purchase drives?
(3) Where can I get the specification of the data output by the DMA port (what people refer to as ASCI I think)?
(4) What kind of software would I need to write/obtain to make this work"?

Any information would be greatly helpful. Is there a "Frequently Asked Questions" kind of wqrite up about building hard drives for the ST?

ONLY, repeat ONLY iff 1) there is full source for ST, Unix, VMS, and whatever, 2) ONLY (again) if there is only ONE, repeat, ONE version, fully controlled by ONE group (not 10+ like lharc), 3) ONLY if it is so much better than zoo (2.01 or 2.10 or the new, soon to be released version) that it is much faster (both compression and decompression), much easier to use (command line interface, arguably zoo's single weakness, with hooks to add it to arcgsh et al for those prefering GEM), much better compression, much more feature laden, but not so much as to get in the way, etc.

please do NOT start posting archives in this format. i would propose a vote (here?), preceded by extensive testing (on ALL platforms) before this happens. and i am reluctant to use anything labeled "beta" for archival. beta s/w should be used by beta testers, NOT the entire community.

[note that my initial reaction, of course, was "SHEESH! ANOTHER ARCHIVER FORMAT TO DEAL WITH" but i calmed down... :-)]

I think that a discussion of chip technology is wholly
relevant to this newsgroup, as long as Motorola 680x0 chips are a
main part of the discussion. I shouldn't use the term war, I
consider this to be a "discussion".

>the i486-25 with Weitek 4167 does 10+ MFLOPS and the ranges of MIPS for
>the 486-25 is from 11 to 15 MIPS.
>
I don't have MFLOPS statistics myself, so I'll take your
for truth. You mention a Weitek math coprocessor, which is not
made by Intel. That is something separate which is an additional
cost beyond the 486. Also, MFLOPS stands for "millions of
floating point operations per second". That is very important for
some programs (such as ray-tracers), but less relevant for other
programs, such as DTP. That's why benchmarks stink. For a DTP
application, MIPS is more important, although I'd prefer to hear
some Dhrystones and SpecMarks numbers as well.

>requirements, unless you go out and buy a UNIX box.

Isn't that great? A unix box that costs less that an Amiga 3000 and it
even has ethernet built in.... Maybe you should have waited longer than
6 years to make your decision...

>
>And at that it's one of the cheapest machines out there.
>
>> MY atari does what I need it to do.
>
>You're satisfied, but have you used a real computer?

Yep... Every day... I use computers that have more raw processing power
than 100 Amigas running in parallel processing...

Sounds like you didn't look around too much. You can get a used Sun 3
with 4 Meg ram for under $1000...

>
>There really is a basic, fundamental difference between the Amiga and the rest.
>Your arguments make good sense when comparing Ataris and Mac and IBMs, but
>there *is* something better.

Of course there is. Buy a NeXT. I can get a NeXT with a 100M HD, 2.88M
floopy, a MUCH better user interface, built in sound digitizer, *nix OS (MACH)
plus many other ammenities for less than a Amiga 3000.... So
please, don't cop the attitude that Amiga is the best buy for the money.
Wake up... Steve Jobbs strikes again... (and I could add 32bit color
for $1500 more) And, the NeXT has a 68040, display postscipt and a
400dpi laser printer... (I have an Atari 520 and I would still buy one

today... of course, I would get my NeXT too...)

I did this with a NEC-2D and the monochrome image came out about 1/3 of
a screen high.

>Don't worry, the worst bit isn't making this - it's getting the
>13-pin Atari monitor connector for the ST side and solder it !!

I simply cut my Atari cable and soldered in a pair of DB-15's. They're
really easy to find. When I got tired of switching monitors by changing
DB-15 plugs, I built a switch using a 7-pole rotary, and some MORE DB-15's.
The one I found in a surplus store for $US 3.95 had 5 positions, but I only
used two.

A while ago I posted a plea for information concerning hard disk drives. I am
in the market for one and I'm interested in what is being used out there.
Whats good, bad? Why?

For example, is the Supra any good? Is it slow/fast/noisy?

Forget about that Amiga crap - I need some honest help here!

Bob Malay

Frankly, I recommend everyone to buy ICD stuff, be it internal or external.
The problem of hard drives is much of a software nature and I think most
people agree that ICD's are the best. And then you can buy any of the
SCSI drives in the market. Mine is Conner Peripherals' SCSI drive housed
by a Japanese case and power supply, etc. and it is quieter than my MEGA ST.
The speed? It is rather slow but 570 KB per second, which isn't too bad (
I understand 500+ KB per second things are generally regarded as fast).

Cheers,
Tsuji

I can't really debate the reasoning behind now moving this discussion to the comp.sys.amiga.advocacy SIG. The original message has grown into something that wasn't really it's original intent. I have been able to help close to twenty Atari users so far, so the message has served it's purpose. I read and listened to those Email replies whichdiscussed this in a civil manner (Most of the hostile messages were deleted before I finished reading them). For this reason I'll ask everybody who expects a reply to leave your message in the comp.sys.amiga.advocacy SIG. One final note: Please re-read the original message with an open mind and see what I mean about "growing into something".

WordPerfect IS succeeding in the US market... in fact, it's one of the largest software companies in the entire world..!

It's Atari Corp which has screwed up the US market, virtually assuring us that we will NEVER see an upgrade to WordPerfect 4.1 for the ST.

WordPerfect can't sell product to non-existant customers with non-existant computers.

What may or may not have happened in Germany isn't going to affect the US market much, if at all...

BobR

741. Amiga is better then what???

Source record: 230876

Tom, Apparently you have not really used an Atari computer...
There are many offerings available on the ST that are not available on any other computer to date.
Since atari does not make the ST computer any more that I know of you must compare the capabilities of the STe to that of the amiga.
A 1040 Ste compares VERY favorably to an amiga 500. The ONLY thing the amiga 500 has over the atari is the fact that the atari can not do as many colors on the screen at the same time...
However there is a 24bit card available for $800 with a coprocessor of some sort for really good graphics...
Adding things to the ST come alot cheaper over all then on the amiga and the standard equipment atari sells is of better quality on average.
Compare....
An Ste with tos 1.6 and blitter performs pretty well...
Compared to an Amiga 500 the amiga only has a slight edge over the Atari..
(Note: for the price no other computer even comes close...)
Compare OS's... The St is built with a much more complete OS then ANY of the amiga OS's.. (The 2.0 doesnt really count at this point since last time I looked it was not available on amiga 500's yet)
If you compare the amigas 2.0 to the Mega Ste's 2.x and the TT's 3.X the atari beats it hands down.
(Beats it in all areas of ease of use and of pure power...) Of course the amiga does multi task but I have very little use for multi tasking..
(I use a 25 mhz '386 with desqview.. On the BBS multi tasking is nice..)
VERY few people I talk to use multi tasking more then ocassionally.
As to sound? Well The ST is the only one so far that has the capability of 3d sound. The STe series computers have the capability of using 3 seperate speakers with different sounds out of each.... 2 of those full 8 bit digital..
It is easy to use HD floppies on an ST.. I have yet to see on on an amiga...
Since the ST uses standard parts it is easy to get most of the items...
Comparing an ST to an Amiga at purely CPU intensive things the Amiga can not be compared very favorably.
The amiga has a hand up on the serial port since the ST is limited to 19200 baud...

ALL the memory can be used in an ST as compared to the amigas limitation of chip memory... (Note the ST does not waste memory... You must waste memory on an amiga to do double buffered graphics and digital sound at the same time.)
Each has its own strengths and weaknesses.. The Standard ST is MUCH better suited to bussiness then an amiga. However the Amiga is better suited to games and higher resolution color work...

Start comparing at the TT to amiga 3000 level and the difference is alot less..
The TT can do some graphic modes the amiga would be jelous of and visa versa.
The sound systems are for the most part the same.. Differences can be over

come by the speed of the processor. If you REALLY push it the amiga can do a few things better in the graphics arena though.. Over all though you have no bussiness stating the ST is no where as good as the amiga.. It is not true..

However Atari USA is missing the boat....
Actually someone shot the boat they were on while they were sipping a toast to what they thought was going on... Then federated almost killed them..
From the current trends I would predict that the Atari will come on very strong in the next five years.. If Atari ever gets over their fatuation of keeping low graphics to keep the price down and offer a multi tasking environment then there will be nothing any amigaite can say against the ST... ;-)
(Multi tasking doesnt make a better machine but since most people dont realize they are not gonna need it they think they need it and might lewt it make some sort of an effect on them..)

742. Re: TOS ERROR #35: What is it?

Newsgroup: comp.sys.atari.st
Date: 1991-06-26 04:46:07 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <43684@cup.portal.com>
Source record: 230869

TOS Error 35 generally means the program is corrupted somehow...

Your FLASH disk has probably developed a bad sector which renders the program useless...

The best defense against this happening is to back up every disk and only run programs from the backup disk... if anything happens to the programs on that disk, you can always copy the original disk onto a new disk and use that...

BobR

(Sorry for not quoting the original message, but my ST has died, and I'm being forced to use an IBM system with PROCOMM.. about 10% the functionality of an ST with FLASH...)

>adamd@rhi.hi.is (Adam David) writes:

vvvvvv
>>TOS has yet to be junked. In all seriousness Atari, why not have a REAL OS
>>in ROM and the option to load TOS and GEM from disk for backward compatibility?

I think a little explanation is in order. Maybe junked was a rather unwise
choice of words. The point I intended was more in the sense of recycling.
I sincerely believe that both TOS and GEM have outlived their allotted lifespan
as the central OS foundation in ROM (where indeed they take precious space and
considerable chunks are often replaced by RAM resident routines anyway).
I did not say they had outlived their usefulness. I'm sorry if I implied that.
To put things in perspective I still use CP/M on Z80. I don't get rid of a thing
which still has some use in it.

From a historical viewpoint, TOS started off as a RAM based OS probably because
it was still being written. It stabilised into TOS 1.0 the first ROM version.
Since then we have had infrequent updates usually with only minor changes. A few
bugfixes are made (sometimes in the wrong direction :-() and a few utilities
added. Suddenly in recent times versions 2.x and 3.x appear with a few more
bells and whistles. A completely new GDOS is arriving (in RAM of course). TOS
and GEM almost became fossils in ROM. Some of the material in the ROM should
(IMHO) rather be made RAM resident so that updates can be made available and
to give better system flexibility. Manipulation of system-specific hardware
obviously belongs in ROM but I would like to be able to load GEM when I need
it, and reclaim its space when I don't.

>TOS is usable. TOS is useful.
>And personally, I think GEM is a real gem. It has all the potential
>to rival the MacOS.

>And with the advent of Atari Unix we also have a full-featured SysV.4.
>Think about it.

Nice stop-gap :-) :-) :-)

[explanation: In a few years time look back with nostalgia and say
"I still use Unix"]

>The XBIOS floppy routines worked with HD drives from the day they were
>created, likewise for BIOS and GEMDOS. Now, isn't that a sign of
>thoughtful design?

Yes. The low-level stuff for this is all in place, as it should be. Only very recent versions have a GEM format option for other than a simple choice between single and double sided disks. IMHO the only sensible sector size to use on HD disks is 1024 bytes (except for MSDOS compatibility when needed). If I understood correctly, only the first and latest versions have been able to handle these. In which version number was it fixed?

Wouldn't it be sensible to have reasonable control over disk format built into the desktop?
Shouldn't a decent ramdisk be included in the ROM?
A simple text editor would not be out of place in the ROM.

>With machines speeding up considerably and speeders all over the place,
>the need for fine-tuning the ROM code diminishes. It's more important
>for Atari to have control over the various TOS development lines, and
>this is near to impossible to do with hand-optimized code.

It could be worked on in-house as a non-optimised version and then run through an optimiser for production. Both speed and space are at a premium even in these days of multi-megabyte accelerated systems (Whoever thought back then that 4 MB wouldn't be enough RAM). Optimisation could be made almost automatic, the only handwork necessary would be to mark which parts of the code must not be changed because they are in some way critical.

Just eliminating redundant reassignment of variables and making absolute long references into absolute short where possible would save enough space to fit STE TOS versions into older ST computers without having to move ROMbase to the newer (and lower) address.

Enough said for now. This is meant as constructive criticism.

Ian doesn't seem to have an Internet address, and mail sent to the Citadel
BBS in Denver that he used to call has not been answered.

However, Mike Dorman, the person from whom I obtained GEMFAST 1.5, seems
to have a channel to him (perhaps through BIX). If you'll send the report
to me I'll try to have it forwarded to Ian via Mike.

(Oh, by the way, I now have the MadMac source code for GEMFAST 1.5, and
I'll mail it off to atari.archive sometime soon.)

Here's a note from Ian that was reposted on GEnie.

|Category 3, Topic 23
|Message 13 Mon Jun 24, 1991
|M.DORMAN2 [Mike Dorman] at 22:24 EDT
|
|The official word from Ian Lepore:
|
| GemFast is one of the few things I'm willing to put a lot of support effort
|into. If folks want to pass bug descriptions along to me, I'll do my best to
|fix them. I don't require source code fixes. GemFast is a strange and
|convoluted critter internally, it'd be unfair of me to ask other folks to wade
|through it and find my bugs. If they can't give a good description of the
|bug, I'm willing to accept their executable file and a description of how to
|navigate my way in their program to the point where the bug happens. I have
|good tools for logging what the AES and GemFast are doing internally, so I may
|be in a better position to debug than they are.
|
| The first thing to ask folks when they mention a GemFast bug is: what version
|are you using? If not v1.5, all bets are off, I *know* there's bugs in
|earlier versions. :-) I don't guarantee 2-day turnaround on bugfixes or
|anything, but I can often find a workaround real quickly, and if it's a major
|bug, I start thinking about a new release. (Speaking of which, I've been
|thinking of v1.6 for a while now anyway, I have no bug reports in yet, but I
|do have some outstanding requests for new functions. Now would be the time
|get those bug reports in...)
|
| In fact, a new GemFast release is the next thing on my to-do list after I

|finish the 'heat-and-serve' release of Sozobon, which ought to be within a
|week or so. (That's what I said a week ago, however!)

I don't know what he means by heat-and-serve Sozobon C, but it does sound
interesting, doesn't it?

It contains all information you need about TOS and GEM (well, I HOPE so...), including all new features up to TOS versions 2.05 and 3.05. The second half of the book contains lots of technical details about the hardware (again including the STE/Mega STE and TT hardware; SCC, SCSI and so on).

The price will be DM 89.- oder 99.-. And yes, we (the authors) and Sybex *ARE* interested in translations. Please contact Sybex U.S. or an other US book company, if you are _really_ interested that this will be done.

>Thanks,

The fontmap file maps between the PostScript font names (e.g. /Times-Roman) and GhostScript font FILES (e.g. ptmr.gsf). It live in the ./fonts subdirectory. Now, to make the rest of it work, you need to modify your GS_LIB variable:

GSLIB=e:\ghostscr.ipt\fonts,e:\ghostscr.ipt\ps

Basically, it's a search path for any file GS wants to open. Can't remember if the slashes face forward or back (forward in the variable, backwards on the command line?).

That's right... The monochrome image is small and placed to one side.
The best soulution is a multisync with individual adjustment for EACH
mode on the back panel (my friend has one like that). Else you have to
adjust HEHT, HORISONTAL and VERTICAL offset all the time :-(

++ What am I doing wrong? What's this fontmap it's looking for?

If anyone else sees this error, it's covered in the readme file. The GS_LIB
env-var hold the pathnames to the subdirectories 'ps' and 'fonts' and should be
(in the example) e:/ghostscr.ipt/ps,e:/ghostscr.ipt/fonts.

BTW - The postscript generator in the software suite accompanying the Yale
Bright Star catalogue appears to generate valid PS files. Ghostscript
successfully produces prn_1000 files from the PS output. Looks good.

>support in MiNT is better. :-)

If you are using the wrong version of LHarc, it IS slow. The slowes of them
all is John Webbs 0.xx. The LZH 1.13.20 is about 4 times faster than the
original 1.13, because the whole compression and decompression is entierly
written in assembler. It should be about twice as fast as LHA 1.21 in
decoding and about 3 times faster in coding.

>the problem. until all the various lharc developers (many of whose work
>by itself is excellent, BTW) get together and standardize an extensible
>file format, this is basically still russian roulette.
If you have any problem with any archive and the version 1.13.20 or newer,
why not send it to me. If the archive is not damaged or if it is'nt coded
with LHA 2.xx on a PC, I will adapt my version of LHarc to read this kind
of archives.

If you get an error-message "Unknown method", your archive is packed with
LHA 2.xx on a PC. This is impossible to adapt to the atari st until there
are sources available,

If you get CRC-Errors on many files, you probably have a damaged archive.
You could then try to download it again.

>it, and reclaim its space when I don't.

TOS is making its way in just the direction you're pointing at; it is
becoming more modular. MetaDOS essentially replaces GEMDOS. GDOS is
disk-based and allows for external screen drivers. (NVDI is such a
GDOS/screen driver combo.) In fact, TOS is quite modular in itself due
to the hierarchical architecture.

If you like, you can work without GEM on your ST today. Just place a
command shell into your AUTO folder. Isn't MiNT meant just for purposes
like these?

>>The XBIOS floppy routines worked with HD drives from the day they were
>>created, likewise for BIOS and GEMDOS. Now, isn't that a sign of
>>thoughtful design?

>Yes. The low-level stuff for this is all in place, as it should be. Only very
>recent versions have a GEM format option for other than a simple choice
>between single and double sided disks. IMHO the only sensible sector size to
>use on HD disks is 1024 bytes (except for MSDOS compatibility when needed).
>If I understood correctly, only the first and latest versions have been able to
>handle these. In which version number was it fixed?

The current TOS versions cannot handle a physical sector size of 1024
bytes. It's not unreasonable to suppose that this won't ever find its
way into TOS again due to compatibility problems. Older TOS versions
won't understand the new format. It isn't even sure that new machines
will have a 1772 built-in that offers such capabilities.

As I stated a while ago, I tested a third-party floppy driver some time
ago which offered 1024-bytes-per-sector support. I also haven't given up
the idea of writing a floppy driver on my own. It's not impossible.
The German magazine 'ST-Computer' recently had a full-featured listing
of a replacement for the standard floppy driver allowing for up to

ten disk drives connected to one ST.

>Wouldn't it be sensible to have reasonable control over disk format
>built into the desktop?

A choice between 9, 10, 18 and 20 sectors per track would be nice, yes.

>Shouldn't a decent ramdisk be included in the ROM?

Dunno. I don't like the idea very much to include such a beastie into
ROM. I would like to have some more RAM disk support in TOS when it comes
to making memory reset-resident.

>A simple text editor would not be out of place in the ROM.

I disagree. This would be completely out of place. Except perhaps as
a new GEM object type. (NeXTStep offers things like this.)

>It could be worked on in-house as a non-optimised version and then run through
>an optimiser for production. Both speed and space are at a premium even in these
>days of multi-megabyte accelerated systems (Whoever thought back then that 4 MB
>wouldn't be enough RAM). Optimisation could be made almost automatic, the only
>handwork necessary would be to mark which parts of the code must not be changed
>because they are in some way critical.

The time-critical sections are already written in assembler, especially
the BIOS and the lower screen driver routines. They could and should
be faster, however.

>Just eliminating redundant reassignment of variables and making absolute long
>references into absolute short where possible would save enough space to fit
>STE TOS versions into older ST computers without having to move ROMbase to the

756. Profile editor for Dr.T's X-oR

Newsgroup: comp.sys.atari.st
Date: 1991-06-26 14:15:07 UTC
From: whitcomb@aurs01.uucp
Message-ID: <59946@aurs01.UUCP>
Source record: 230813
Cross-posted to: comp.sys.atari.st,rec.music.synth

A new version of E-oR, the profile editor for Dr.T's X-oR universal patch editor/librarian is now available for the Atari ST.

For the uninitiated, X-oR is a program that manages all the system exclusive messages for any MIDI capable machine (be it a synth, effects box, MIDI mixer, switcher or whatever). The catch is, someone has to write a "profile" for your machine. This profile converts your machines system exclusive data into parameters that may be used by X-oR. E-oR is a tool that allows you to do write, modify and test profiles for X-oR. It has its own interpreted command language (XORCL), although much of writing a profile consists of setting up data and parameter tables.

Once a profile has been written, it may be used with any of the four platforms for X-oR (ST, Mac, PC and Amiga). For now, E-oR is only available for the ST.

E-oR V1.3 has an improved XORCL editor screen, with improved program branching and tracing capabilities. A feature that non-programmers will especially like is the new parmob editing features. This lets you highlight any object or group of objects on the editing screen with the mouse (sliders, text boxes, envelope boxes, etc.) and manually move them with the cursor keys. This means that if you don't like the screen layout on one of your existing profiles, you can change it easily.

Various other changes and bug fixes have been made. Writing a new profile from scratch is still no picnic, but many of the more tedious tasks have been simplified.

E-oR can be downloaded from GEnie (if you own a registered Dr.T's product), and can probably be gotten from Dr.T's directly by calling their customer service line (617-455-1454). The program doesn't cost anything if you own X-oR (and why would you want it otherwise?), although you'll probably have to pay for the disk and postage if you have it sent.

Hm, are there supposed to be more font files with the distribution? The
only one in the distrib I got was UGLY(something).GSF. So .GSF files
have to live in a FONTS directory. To keep my path uncomplicated, I put
the GS executable in the \bin subdirectory. Does my fontmap file have
to live there too or will it suffice to keep put it in some directory
pointed to by GS_LIB?

There are many who would disagree with this statement....

>However there is a 24bit card available for $800 with a coprocessor of some
>sort for really good graphics...

I can get a 24-bit card for $299 (list). It takes advantage of the Amiga's built-in coprocessors. For about $100 more I can get one that also includes a slow-scan video digitizer. This one (DCTV) has been demoed at shows paging full-motion, full-color video off a HD and displaying it through this advice in real time (Watched a few minutes of Back to the Future III...)

>Adding things to the ST come alot cheaper over all then on the amiga and the
>standard equipment atari sells is of better quality on average.

Better quality in what way? I assume you're speaking of quality of 'workmanship' or quality control with this point. What data are you using to arrive at this conclusion?
Besides, if you have a problem with your 500, you FedEx it back to Commodore (at CBM's expense) & it's promptly replaced or repaired & sent back. If your 2000, 2500, or 3000 go bad, and your warranty is still valid (1 year warranty on all models, w/option to purchase an extension), Commodore sends someone to your home to fix it there.

>Compare....
>An Ste with tos 1.6 and blitter performs pretty well...
>Compared to an Amiga 500 the amiga only has a slight edge over the Atari..

I've seen the so-called blitter on an ST. I was not impressed. The Amiga's blitter performs most operations about as fast as a 14 MHz 68020 (according to Dave Haynie, a CBM hardware guy who frequents c.s.amiga.*). The ST's processor runs .86 MHz faster than the Ami's 68000, but the blitter more than makes up for this in all but extremely processor-intensive apps.

Of course, for about $10 (probably less) you can pop a 68010 into your
Amiga & make up for that difference. Unless Atari has finally released a
non-TT TOS version that supports 680(1+)0 chips, ST owners don't have this
option.

>(Note: for the price no other computer even comes close...)

The A500 can be had for about $400 now. It generally also comes bundled
with some software as well.

>Compare OS's... The St is built with a much more complete OS then ANY of the
>amiga OS's.. (The 2.0 doesnt really count at this point since last time I
>looked it was not available on amiga 500's yet)

In what way are they more complete? Do they include a shell environment
as well as a GUI? Do they support multiple simultaneous screens of different
depths, resolutions, and pallettes? (Can the ST even change resolutions yet
without a reboot?) Shared libraries & interprocess communication? (Oops!
No need... no multitasking! Sorry.)

>If you compare the amigas 2.0 to the Mega Ste's 2.x and the TT's 3.X the atari
>beats it hands down.
>(Beats it in all areas of ease of use and of pure power...)

Workbench is just as easy to use as any most other GUIs. Double click
the icon & away you go...
As far as "pure power", I've yet to see a GUI with the pure power of
a Unix-like command line, which is part of the Amiga OS (note that you
don't _have_ to use this; it's just there in case you want to).

> Of course the
>amiga does multi task but I have very little use for multi tasking..

Normally, I'd counter this standard argument with another standard one
("Then you probably haven't tried it yet"....), but...

>(I use a 25 mhz '386 with desqview.. On the BBS multi tasking is nice..)
>VERY few people I talk to use multi tasking more then ocassionally.

Nearly every Amiga user I talk to uses it on a regular basis. I'm doing
it now. A BBS is certainly far from the only time multitasking is useful.
A list of the processes currently running on my system (using Snap, one
of those processes, to clip this text from a window & paste it here):

CLI(1):artm
CLI(2):iprefs
CpuBlit V1.00
AssignX
FaccII
ForFacc
RexxMaster
CLI(4):c:snap
CygnusEd
CLI(3):loadwb

jr-comm
DMouse
Virus_Checker
jrcomm-clock
SD

(Note that I've deleted a number of system processes (devices & handlers)
because they're not things that I specificaly started up in one way or another.)

>As to sound? Well The ST is the only one so far that has the capability of 3d
>sound. The STe series computers have the capability of using 3 seperate
>speakers with different sounds out of each.... 2 of those full 8 bit digital..

How is this superior to the Amiga's 4 channel 8 bit stereo sound? (8 bit
on all 4 channels, not just 2 of them). There's even software (Octaplayer?)
that supposedly pushes out 8 voices. Of course, unlike the ST, the Amiga's
sound is driven by yet another coprocessor, so it takes almost 0 CPU time to
play a musical score or a digitized sound (as a background process in your
multitasking environment, while you work on something else).

>It is easy to use HD floppies on an ST.. I have yet to see on on an amiga...

Applied Engineering and Commodore both make Ami HD drives. The problem
with HD drives on the Amiga is that the floppies are controlled by a coprocessor
(yes, another one!) that allows me to do things like formatting a floppy (which
I'm doing now via the SD process listed above) with little loss of CPU time.
This coprocessor, though, cannot handle the throughput speeds of high density
drives (twice that of the older drives), so workarounds have had to be found.

>Since the ST uses standard parts it is easy to get most of the items...

Eh? Standard parts? Like the standard SCSI drive inside my Amiga, the
standard memory chips, the standard printer connected to my standard parrallel
port right next to the standard serial port which talks to my standard modem?

>Comparing an ST to an Amiga at purely CPU intensive things the Amiga can not
>be compared very favorably.
No? Why not? That .86 MHz doesn't make much of a difference... especially
if the ST also has to use the CPU to do I/O and/or graphics stuff at the same
time. Oops! Forgot again... no multitasking. Never mind.

>The amiga has a hand up on the serial port since the ST is limited to 19200
>baud...
>
>ALL the memory can be used in an ST as compared to the amigas limitation of
>chip memory... (Note the ST does not waste memory... You must waste memory on
>an amiga to do double buffered graphics and digital sound at the same time.)

I can use all the memory in my system too. I just have to keep graphics &
sound data in the 1st 2 megs. Why do you say the Amiga has to waste memory to
do d.b. graphics & sound? Having to keep it in a limited section of memory
only constitutes a limitation, not a waste.
On the subject of memory, what exactly is the difference between "ST

memory" and "TT memory" on the TT? Is ST mem 16 bits wide?

>Each has its own strengths and weaknesses.. The Standard ST is MUCH better
>suited to bussiness then an amiga. However the Amiga is better suited to
>games and higher resolution color work...

Oh? On what do you base this assumption? I really don't know what
business software is available for the ST other than PageStream (is
2.1 out yet for the ST? I've been using it for a while, & am looking
forward to the 2.2 upgrade they're now advertising for the Ami version),
Calamus, and DynaCadd (now also available for the Amiga).
Of course, around here, the Amiga will nearly always win out over
the ST simply because there are no ST dealers around and no sources of
ST software short of mail order. I've been to nearly every computer
store in this state, but have yet to see an ST anywhere.

>Start comparing at the TT to amiga 3000 level and the difference is alot less..
>The TT can do some graphic modes the amiga would be jelous of and visa versa.

If I remember the TT specs correctly, the only grahics mode the TT has
that can outdo a stock Amiga 3000 (or any other model, if it weren't for the
flicker in interlace mode on <3000 Amigas) is the 1024x960 mono mode which
needs a special monitor. With the CBM A2024 monitor or Moniterm Viking, any
amiga can do 1008x800 (1008x1024 in PAL mode) mono.

>The sound systems are for the most part the same.. Differences can be over
>come by the speed of the processor. If you REALLY push it the amiga can do a
>few things better in the graphics arena though.. Over all though you have no
>bussiness stating the ST is no where as good as the amiga.. It is not true..

From what I've seen of the ST it doesn't take much pushing for the Amiga's
graphics to beat it. The processor speed differences (ST vs A500) are so small
they're almost irrelevant; the Ami's blitter, copper, and other coprocessors
make up for them easily.

>However Atari USA is missing the boat....
>Actually someone shot the boat they were on while they were sipping a toast
>to what they thought was going on... Then federated almost killed them..
>From the current trends I would predict that the Atari will come on very strong
>in the next five years.. If Atari ever gets over their fatuation of keeping
>low graphics to keep the price down and offer a multi tasking environment then
>there will be nothing any amigaite can say against the ST... ;-)

From the current trends I would predict that Atari sales will continue to
be negligible in the US and falling in Europe. Sales of the TT might go well
for a little while as current ST owners upgrade, but IMHO, they'll die down
shortly. I would also predict that Commodore's sales will continue the steady
rise they've been experiencing worldwide.

>(Multi tasking doesnt make a better machine but since most people dont realize
>they are not gonna need it they think they need it and might lewt it make some
>sort of an effect on them..)

Multitasking _does_ make a better machine for any machine that's not completely dedicated to a single task. I won't buy a computer that can't do it, and feel extremely claustrophobic when I find myself having to use one that can't.

The fontmap file needs to be in the GS_LIB path. Regarding fonts, there are no further .gsf fonts in the distribution, but they are freely available from various ftp sites. You can also make them yourself from .bdf fonts on Unix.

766. MiNT, MGR, emacs, problems and questions

Newsgroup: comp.sys.atari.st
Date: 1991-06-26 18:31:11 UTC
From: peter@geog.ubc.ca
Message-ID: <1991Jun26.113111@geog.ubc.ca>
Source record: 230894

Hello, I am setting up a system with MiNT and MGR and have encountered some problems and questions that I hope someone could help with:

1. MGR works fine with the init.prg supplied with MiNT, but if I try to use BASH or gulam as my shell, then I get a "can't get a pty" error when I try to open a windom. (I remember someone mentioning a solution to this before, but didn't take note at the time)

2. BASH seems to choke when using the LS.PRG supplied in akputil7.zoo - I get a bus or addressing error and MiNT crashes. LS.PRG seems to work fine with other shells. Has anyone else encountered this? Is there another LS that I should be using?

3. What (emacs-ish) editor are people using with MiNT/MGR? I have tried mg2a inside a mgr vt52 widow - the text came up fine, but every keystroke generated garbage (an @ character I think). I had problems with me310 as well.

4. Has anyone compiled gnu-emacs to operate under MiNT and allow multiple shells etc? (This is my preferred windowing environment) If so, would they care to share the changes that were necessary to compile the sources?

Thanks very much for any help, I will be happy to provide any information I receive to others or summarize and post if there is sufficient interest.

767. Syquest on Spectre

Newsgroup: comp.sys.atari.st
Date: 1991-06-26 18:46:40 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1991Jun26.184640.18120@rodan.acs.syr.edu>
Source record: 230724

I've got a made-for-mac-syquest (Cutting Edge) hooked up to my
ST via an ICD SCSI port. I use it for my ST, my ATSpeed, and
Spectre. I have cartridges partitioned for ST and for Mac.
At home on my ST, everything is fine, i.e. my ST and msdos
emulator read the ST formatted partitions and Spectre reads
the Mac partitions. I brought a cartridge over to a friend
with a mac and a different brand Syquest drive, and his mac
did not recognize anything on my cartridge. Furthermore, he
claims he has software on his mac that would recognize PC
formatting, so something is really wrong here.
Can anyone help me out?
Thanks.
Gerry

768. MSDOS 5 warning!

Newsgroup: comp.sys.atari.st
Date: 1991-06-26 18:57:09 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1991Jun26.185709.18826@rodan.acs.syr.edu>
Source record: 230723

I got MSDOS 5 and installed it on my hard disk for my ATSpeed. After doing this, however, I could not reboot my ST...evidently the new DOS rewrites the FAT on the hard disk, or something like that (which I later read on an msdos newslist posting). I was able to install the DOS on a partition of my removable cartridge without affecting my ST boot partition...so, I'm actually not in such bad shape.

If you have an IBM emulator, be careful installing DOS 5. I'm not sure what is actually going on, but I do know it caused me quite a bit of grief...If someone else knows what is going on, I'd be happy to hear about the details and to know if it is possible to have DOS 5 share a fixed disk with an ST boot partition on it. Until then, I will be leaving it on my removable ...

I'd be interested to hear others' experiences.

You must be kidding. At least here in Germany, nobody cares when your A2000
breaks down. Especially Commodore won't care.

> I've seen the so-called blitter on an ST. I was not impressed. The

You have probably seen the desktop build up windows with and without a
blitter, using TOS 1.02. This means you ain't seen nothing yet.
Blitter support in TOS is not as it could be, and in general one
is tempted to say that Blitters Are Not Important. You can speed up
graphics a lot more by software.

>Amiga's blitter performs most operations about as fast as a 14 MHz 68020
>(according to Dave Haynie, a CBM hardware guy who frequents c.s.amiga.*).

The ST blitter won't stand much behind in these terms. It's just that
the Amiga OS and architecture much more relies on the fact that there
is something like a blitter and therefore uses it much more than TOS.

> Of course, for about $10 (probably less) you can pop a 68010 into your
>Amiga & make up for that difference. Unless Atari has finally released a
>non-TT TOS version that supports 680(1+)0 chips, ST owners don't have this
>option.

TOS 1.06, TOS 2.05, TOS 3.01 and TOS 3.05 support the 68010. Nevertheless,
you won't gain much from a 68010, as experiments have shown.

> In what way are they more complete? Do they include a shell environment

>depths, resolutions, and pallettes? (Can the ST even change resolutions yet
>without a reboot?) Shared libraries & interprocess communication? (Oops!
>No need... no multitasking! Sorry.)

Sigh. We've had cooperative multitasking from the start. Applications
and accessories can send messages to each other. And I don't think the
Workbench is much of a real GUI - not before Kick 2.0, at least.

> Workbench is just as easy to use as any most other GUIs. Double click
>the icon & away you go...

Just try to view all files in a folder with the standard workbench.
You won't get them. Instead, you have to confine yourself to a command
shell. That's not the way GUIs were meant to work.

>CLI(1):artm
>CLI(2):iprefs
>CpuBlit V1.00
>AssignX
>FaccII
>ForFacc
>RexxMaster
>CLI(4):c:snap
>CygnusEd
>CLI(3):loadwb
>jr-comm
>DMouse
>Virus_Checker
>jrcomm-clock
>SD

If you look at this list closely, you'll realise that most of the
processes mentioned are equivalents of TSRs. CpuBlit is a text output
speeder (BTW, interesting to know that you're using CpuBlit while
you're claiming that your blitter is much faster than a ST blitter).
DMouse is a screen saver/mouse speeder package. Virus_Checker is also
of the TSR type. If you think about it, you'll see that the list
above was no good example for real multitasking. When working with
my ST/TT, I have at least that many processes and resident programs in
my computer.

Don't get me wrong:
I don't question the usefulness of preemptive multitasking. It's just
that you gave a bad example of your usage of this feature.

> How is this superior to the Amiga's 4 channel 8 bit stereo sound? (8 bit
>on all 4 channels, not just 2 of them). There's even software (Octaplayer?)

>play a musical score or a digitized sound (as a background process in your
>multitasking environment, while you work on something else).

I couldn't care less if my computer has 3 or 4 digital voices. It just
doesn't matter. If you're making professional music, you can't make use
of the home-computer bleep-style digital channels the STe and Amiga
offer; instead, you will use MIDI devices (that's why the ST has a
MIDI port built-in). If you're running standard applications, you don't need

sound except the occasional beep when you've done something wrong.

For your information: The STe/TT digital sound chip has an own DMA
channel, just like the Amiga.

> Applied Engineering and Commodore both make Ami HD drives. The problem

To my knowledge, there is no HD drive for the Amiga that handles standard
MFM disks. A real pain when shuffling data to a PC.

> No? Why not? That .86 MHz doesn't make much of a difference... especially
>if the ST also has to use the CPU to do I/O and/or graphics stuff at the same
>time. Oops! Forgot again... no multitasking. Never mind.

See above. The floppy controller and the ACSI bus have an own DMA channel.
In the TT, there is a second SCSI DMA channel.

> On the subject of memory, what exactly is the difference between "ST
>memory" and "TT memory" on the TT? Is ST mem 16 bits wide?

To the video chip, it is even 64 bits wide.

1280x960. 72 Hz. Without a special graphic card. IMHO, a big advantage and
one of the reason why I bought a TT.

771. Re: What's a STE anyway?

Newsgroup: comp.sys.atari.st
Date: 1991-06-26 20:53:55 UTC
From: freds@hpspdla.spd.HP.COM
Message-ID: <12020006@hpspdla.spd.HP.COM>
Source record: 230805

Well so far a few folks have helped me understand just what the
STe is.

Here is a brief summary:

1. Donate the ST to a school

2. The low resale value of the STs is due to the low
new price of the STes.

Differences of ST and STe

MEGA STe MEGA ST

TOS 2.5 TOS 1.2/1.4
internal HD (SCSI 48M) not included
68000 16 MHz + chache 68000 8 MHz no chache
DMA sound old stlye sound
Hardware scrolling na
Easy memory upgrade not so easy
some extra serial port One serial

3. STe has a new blitter chip new sound chip

Try expanding to the 68030 SST (Dave Small's Board)
Then add a video card such as the ISAC.

==

==

So that all so far.

Has anyone tryed the new SST board? is it easy to install?
how about the SST with a new video card? Does any one have any
experience with the upgrade? Like cost and compatibility with
ST Software?

Thanks again,

freds@hpspdla.spd.hp.COM

Just to let those interested know, I've sold the 520ST, NX-10 printer,
and the Supra 2400 modem. Thanks to all those who responded.

But...

I STILL have the following for sale:

Atari 1040STfm and SC1224 Color monitor. It is 1 1/2 years old and in
PERFECT condition. This includes a mouse, 1 meg ram, internal DS 3.5"
drive, and an RF modulator. I've decided to throw in the following
software: Dungeon Master, Falcon, Tanglewood, Shuttle, ST-Talk,
Grid-Iron, FAS-ST, Haba-Check checking program, all with original
boxes and doc's. I will also include a box of 10 blank disks.
Finally, I'm including 2 joysticks, (Epyx and Winner brands).

I paid over $1100 for all this stuff, but I'm asking only $500.
("Wow, what a great deal!").

---> Please respond to hindi@eniac.seas.upenn.edu <---

Thanks for your time.

773. Unwanted Amiga Input

Newsgroup: comp.sys.atari.st
Date: 1991-06-26 21:55:19 UTC
From: pyr579@oz.plymouth.edu
Message-ID: <1991Jun26.215519.22749@oz.plymouth.edu>
Source record: 230802

You know, I'm really shocked! I've been an Atarian for over 6 years
I've had 8-bits and ST's. I've seen the Atari vs Commodore wars come and go.
I've enjoyed reading the news in comp.sys.atari.st but lately I can't enjoy
any of it without some posting about Amiga's "superiority" from some life-long
commodore die-hards. Great! This is comp.sys.atari.st not comp.sys.amiga.*
and these little battles and irritating posts do NOT belong here. Who is in
charge of this news group anyway? Usually I read down through every article
every day, but I'm not going to if I have to sift out Amiga propaganda all
the time. If these Amiga types want to toot their own horn in there news
group fine, but they shouldn't be cluttering up ours. It seems to me that
unless you are posting something significant about the Atari ST in this
group then your message shouldn't be here. It is too bad people can get
away with this harassment in our newsgroups. Try to E-mail to these
people and you get wise comments and manure back. Get them off our news group.

774. Re: Amiga is better then what???

Newsgroup: comp.sys.atari.st
Date: 1991-06-26 22:56:04 UTC
From: jmay@lunatix.uucp
Message-ID: <1991Jun26.225604.6514@lunatix.uucp>
Source record: 230823

I generally try to stay away from computer wars regardless of the platforms involved so I'll be brief.

In article <677913506.0@therip.FidoNet> Rod.Fulk@f24.n228.z1.FidoNet.Org (Rod Fulk) writes:
>However there is a 24bit card available for $800 with a coprocessor of some
>sort for really good graphics...

There are 24bit cards for the A500 that run as low as $400 list. Granted these don't include racy processors such as i860s or anything but they offer good displays for a good price (you can even choose between RGB or composite (in case you're a video professional)).

>Adding things to the ST come alot cheaper over all then on the amiga and the
>standard equipment atari sells is of better quality on average.

How about some supporting for this?

>Compare....
>An Ste with tos 1.6 and blitter performs pretty well...
>Compared to an Amiga 500 the amiga only has a slight edge over the Atari..

Again, please support your assertions with benchmarks, etc. otherwise they're ineffective as arguments. I'm not an Atari expert so I'd like to see some numbers.

>Compare OS's... The St is built with a much more complete OS then ANY of the
>amiga OS's.. (The 2.0 doesnt really count at this point since last time I
>looked it was not available on amiga 500's yet)

From what little I've read in this newsgroup, there seem to be more than a few people who think that TOS should be trashed (and, of course, some people who think that TOS still has merits). I'm curious how friendly the ST's OS is to program. Is it library-based or something else. From a programmer's POV, the Amiga's libraries make programming even an enjoyable process :-)

>It is easy to use HD floppies on an ST.. I have yet to see on on an amiga...

I agree with you on this point. Thus far, Amiga HD floppies aren't compat. with the 1.4 meg standard (to my knowledge).

>Comparing an ST to an Amiga at purely CPU intensive things the Amiga can not
>be compared very favorably.

How so? Again, benchmarks and the like please.

>ALL the memory can be used in an ST as compared to the amigas limitation of
>chip memory...

This only applies to applications which utilize the custom chips. This has
currently been increased to 2 MB though there are ways around the limitation.

>You must waste memory on
>an amiga to do double buffered graphics and digital sound at the same time.)

Exactly how does the Amiga waste memory doing this?

>The sound systems are for the most part the same.. Differences can be over
>come by the speed of the processor. If you REALLY push it the amiga can do a
^^^^^^^^^^^^^^^^^^^^^^
Which _should_ be considered an important factor. If I offered an engineer
two systems identical systems (note that I am not implying that the
ST and Amiga are identical...) with the exception of processor speed, one
may assume that the engineer will choose the faster of the two.

>few things better in the graphics arena though.. Over all though you have no
>bussiness stating the ST is no where as good as the amiga.. It is not true..

I have made no such claim. However, I have found no facts which state that
the ST is the better of the two.

>(Multi tasking doesnt make a better machine but since most people dont realize
>they are not gonna need it they think they need it and might lewt it make some
>sort of an effect on them..)

I suppose the trend towards multitasking operating systems is bogus then?
Now I'm not going to say that "I'm running a WP, this terminal program, and
am archiving a big program while I type this" because I'm not :-) BUT, I
do have a virus checker running in the background, and I have the aformentioned
multitasking that the OS does on its own going on as I type this. Question:
when you load a program from disk, does the rest of the system come to a halt?
I don't know the ST that well but I will vouch that this doesn't happen on
the Ami.

776. RE: Possible GCR sale... What is the real value of a Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1991-06-27 00:08:15 UTC
From: kawakami@ocf.berkeley.edu
Message-ID: <42482@ucbvax.BERKELEY.EDU>
Source record: 230899

I recently posted a short message asking if $300 is too much for a GCR. It seems that it is actually not much to charge. However, I have to apologize to everyone who offered to buy it, as I am still just thinking about selling it. If I decide to sell it, I will hold an auction later in the summer.

****

Things to think about re the Spectre GCR.

* Mac ROMS are very expensive now. $250+ now. This means fewer sales for the Spectre which means that GBS must focus on other products to produce revenue.

* System 7.0 does not work on Spectre now. It probably will eventually, knowing the way Dave Small works his magic. But the new System will probably not be as compatible as 6.0.3 is for a while.

* On the plus side, a Spectre on a TT or SST030 is a cheap alternative to a Mac II.

* If you have a full blown mono ST system with a memory upgrade and a hard drive with free space, this is a cheap way to become a Mac. If you need to get a hard drive or a ram upgrade kit, the price of "going mac" gets expensive fast (GCR needs 1 meg and a floppy, but 2 megs and ten megs of hard disk are closer to a usable minimum configuration.) The Mac Classic under the educational discount is under $1000 (I'm not sure how much) and it has full compatiblilty as well as giving you another CPU to hack on (sometimes it's very handy to have two machines).

* There is no SuperDrive for the GCR. On the other hand, all disk accesses are faster than most macs' disk accesses.

The GCR is usually very good to me. It rarely ever crashes (under System 6.0.5) and has let me run Microsoft Word 4.0, which seems to be a popular standard around campus. I also did some programming work on it. It is a useful tool. However, it is not as disk compatible as Dave Small would have you believe: it failed on the two drives I was using. One was a late model TEAC, the other was an NEC (which is popular with 3rd party disk makers for some reason). The TEAC never worked right, the NEC was hacked/fixed with instructions by Small. It is supposed to do Mac disks correctly with other 3rd party disk drives.

>>
>> ^ Oh. In that case, I will not use it.

> By all means, PLEASE DON'T! :^)

> I guess I just don't understand that line of thinking......

Don't get me wrong - there is nothing wrong with assembly - I use it often - but
I just don't think it is the "language-of-choice" for writing I/O programs in.
Too scary for me. I don't care if a game crashes and deletes the high-score
file. Sure, it's a bummer, but it IS `just a game'.

Then again, I guess if you can't trust a DC program, what CAN you trust! TOS? :-!

Warwick.

780. Re: Unwanted Amiga Input

Newsgroup: comp.sys.atari.st
Date: 1991-06-27 01:50:36 UTC
From: kawakami@earthquake.Berkeley.EDU
Message-ID: <42485@ucbvax.BERKELEY.EDU>
Source record: 230806

WELLLLLL

I've used Atari computers for something like nine (9) years and I'm REALLY tired of the Atari-Amiga wars (or is that Amiga-Atari wars:-/). Let's be realistic here: for the time being, both machines are stagnant. The only thing happening is the Video Toaster on the Amiga. As far as competing as a general use computer, both machines are beat out by PCs and Macs. Why can this be so, you ask. After all, they both have fine, overpowered and underpriced software and do whizbang things that cost some serious bucks on PCs and Macs. After all, both are really COOL, Macs and PCs are for poseurs and rich-stupid people. Why can this be so? The answer is compatibility. Compatibility with the outside world requires PC or Mac compatibility. The strengths of these machines lie in the amount of data you can access and the amount of work you can exchange and disseminate.

OK, I've simplified. The upper end Amigas are PC compatible. You can buy Mac and PC compatibility for both machines. But to get this compatibility, you must pay money. Why bother; why not get the real thing and be done with it.

If you don't hack, if you are not a hobbyist, you don't need an Amiga or Atari.

*****

BTW, I will probably be using my Atari for some years to come. It does everything I expect of a computer, and I'm happy with that. Once I start expecting more that I get, I will move up to something more powerful.

782. Latest Picture Formats List (Lots of Changes!) [LONG]

Newsgroup: comp.sys.atari.st
Date: 1991-06-27 03:12:17 UTC
From: dmb@wam.umd.edu
Message-ID: <1991Jun27.031217.23884@wam.umd.edu>
Source record: 230814
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

After several months of neglecting to update the list, I've made all the changes that were in the queue all at once. Here's a summary of what's new and improved, and who contributed what:

o Clarification made to IFF format (Jim Omura)
o Spectrum Smooshed (*.SPS) format added (Shamus McBride)
o Lars Michael's RGB Intermediate (*.RGB) format added (Lars Michael)
o ComputerEyes Raw Data (*.CE?) format added (G. "Maddog" Knauss)
o Animaster Sprite Bank (*.ASB) format added (Neil Forsyth)
o STOS sprite (*.MBK) format added (me)
o Cyber Paint Sequence (*.SEQ) format added (me)

Thanks to everyone who's contributed info in the past few months! Also, if I've left something out, don't hesitate to let me know. I think I got all the changes that were "on the stack" in there, but I may have missed something, so don't be bashful if I've left you out.

As always, everyone is encouraged to replace older versions of The List with this one. This time around it's particularly important since so many changes have been made.

Thanks all,

Dave Baggett

PackBits Compression Algorithm

Introductory Information
----
word = 2 bytes

```
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

Caveat: It is wise to mask off the upper four bits of each
palette entry, since a few programs store special
information there (most notably Art Studio).

The Formats
-----------

<NEOchrome> *.NEO

1 word flag byte [always 0]
1 word resolution [0 = low res, 1 = medium res, 2 = high res]
16 words palette
12 bytes filename [usually " . "]
1 word color animation limits. High bit (bit 15) set if color
animation data is valid. Low byte contains color animation
limits (4 most significant bits are left/lower limit,
4 least significant bits are right/upper limit).
1 word color animation speed and direction. High bit (bit 15) set
if animation is on. Low order byte is # vblanks per step.
If negative, scroll is left (decreasing). Number of vblanks
between cycles is |x| - 1
1 word # of color steps (as defined in previous word) to display
picture before going to the next. (For use in slide shows)
1 word image X offset [unused, always 0]
1 word image Y offset [unused, always 0]
1 word image width [unused, always 320]
1 word image height [unused, always 200]
33 words reserved for future expansion
16000 words picture data (screen memory)
-----------
```

32128 bytes total

<NEOchrome Animation> *.ANI

NOTE: To get this feature on versions 0.9 and later select the Grabber
icon and click both mouse buttons in the eye of the second R in the
word GRABBER.
Interestingly enough, some versions of NEO only require you
to press the right button, not both. Hmmm...

1 long magic number BABEEBEA (hex) (seems to be ignored)
1 word width of image in bytes (always divisible by 8)
1 word height of image in scan lines
1 word size of image in bytes + 10 (!)
1 word x coordinate of image (must be divisible by 16) - 1
1 word y coordinate of image - 1
1 word number of frames
1 word animation speed (# vblanks to delay between frames)
1 long reserved; should be zero
----
22 bytes total for header

? words image data (words of screen memory) for each frame, in
order

<DEGAS> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)

32034 bytes total

<DEGAS Elite> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)

32066 bytes total

<DEGAS Elite (Compressed)> *.PC1 (low resolution)
*.PC2 (medium resolution)
*.PC3 (high resolution)

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control/data bytes
4 words left color animation limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag [0 = left, 1 = off, 2 = right]
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)

< 32066 bytes total

Compression Scheme:

PackBits compression is used (see below). Each scan line is compressed
separately; i.e., all data for a given scan line appears before any data
for the next scan line. The scan lines are specified from top to bottom
(i.e., 0 is first). For each scan line, all the data for a given bit plane
appears before any data for the next higher order bit plane. Note that this
is identical to the IFF 'BODY' image data.
To clarify: The first data in the file will be the data for the lowest
order bit plane of scan line zero, followed by the data for the next higher
order bit plane of scan line zero, etc., until all bit planes have been
specified for scan line zero. The next data in the file will be the data
for the lowest order bit plane of scan line one, followed by the data for
the next higher order bit plane of scan line one, etc., until all bit planes
have been specified for all scan lines.

Caveats:

DEGAS Elite's picture loading routine places some restrictions on
compressed DEGAS files:

o Elite uses a 40-byte buffer to store data being decompressed.

o Whenever a control command is encountered, bytes are stuffed
in this buffer.

o The buffer is only emptied when there are EXACTLY 40
characters in it.

The important conclusion here is that

No control command may cause the buffer to have more than 40
bytes in it. In other words, all control commands must end on
or before the 40-byte boundary.

Any picture violating the last condition will cause Elite to get a bus
error when the picture is loaded.

<Tiny> *.TNY (any resolution)
*.TN1 (low resolution)
*.TN2 (medium resolution)
*.TN3 (high resolution)

Several people have reported sightings of mutated Tiny pictures that
do not follow the standard format, so let's be careful out there. What
is described here is the format that David Mumper's original
TNYSTUFF.PRG produces.

1 byte resolution (same as NEO, but +3 indicates rotation
information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits
hold left (start) limit; low 4 bits hold right (end) limit
1 byte direction and speed of color animation (negative value
indicates left, positive indicates right, absolute value
is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

16 words palette
1 word number of control bytes
1 word number of data words
3-10667 bytes control bytes
1-16000 words data words

42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 word is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

Format of expanded data:

The expanded data is not simply screen memory bitmap data; instead, the
data is divided into four sets of vertical columns. (This results in
better compression.) A column consists of one specific word taken
from each scan line, going from top to bottom. For example, column 1

consists of word 1 on scanline 1 followed by word 1 on scanline 2, etc.,
followed by word 1 on scanline 200.
The columns appear in the following order:

1st set contains columns 1, 5, 9, 13, ..., 69, 73, 77 in order
2nd set contains columns 2, 6, 10, 14, ..., 70, 74, 78 in order
3rd set contains columns 3, 7, 11, 15, ..., 71, 75, 79 in order
4th set contains columns 4, 8, 12, 16, ..., 72, 76, 80 in order

Note that Tiny partitions the screen this way regardless of resolution; i.e.,
these aren't bitplanes. For example, medium resoltion only has two bitplanes,
but Tiny still divides medium resolution pictures into four parts.

<Spectrum 512> *.SPU

80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)

51104 bytes total

Note that the Spectrum 512 mode's three palette changes per scan
line allow more colors on the screen than normally possible, but a
tremendous amount of CPU time is required to maintain the image.

The Spectrum format specifies a palette of 48 colors for each scan line.
To decode a Spectrum picture, one must be know which of these 48 colors
are in effect for a given horizontal pixel position.

Given an x-coordinate (from 0 to 319) and a color index (from 0 to 15),
the following C function will return the proper index into the Spectrum
palette (from 0 to 47):

```
/*
* Given an x-coordinate and a color index, returns the corresponding
* Spectrum palette index.
*
* by Steve Belczyk; placed in the public domain December, 1990.
*/
int
FindIndex(x, c)
int x, c;
{
int x1;

x1 = 10 * c;

if (1 & c) /* If c is odd */
x1 = x1 - 5;
else /* If c is even */
x1 = x1 + 1;
```

```
if (x >= x1 && x < x1 + 160)
c = c + 16;
else if (x >= x1 + 160)
c = c + 32;

return c;
}
```

<Spectrum 512 (Compressed)> *.SPC

```
1 word flag word [$5350 or "SP"]
1 word reserved for future use [always 0]
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map
--------------
<= 50014 bytes total
```

Data compression:

Compression is via a modified run length encoding (RLE) scheme, similar to DEGAS compressed and Tiny. The data map is stored as a sequence of records. Each record consists of a header byte followed by one or more data bytes. The meaning of the header byte is as follows:

For a given header byte, x:

```
0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= -1 Use the next byte -x + 2 times
```

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three palettes for each scan line (597 total). The color map is stored as a sequence of records. Each record starts with a 1-word bit vector which specifies which of the 16 palette entries are included in the data following the bit vector (1 = included, 0 = not included). If a palette entry is not included, it is assumed to be zero (black). The least significant bit of the bit vector refers to palette entry zero, while the most significant bit refers to palette entry 15. Bit 15 must be zero, since Spectrum 512 does not use palette entry 15. Bit 0 should also be zero, since Spectrum 512 always makes the background color black. The words specifying the values for the palette entries indicated in the bit vector follow the bit vector itself, in order (0 - 15).

NOTE: Regarding Spectrum pictures, Shamus McBride reports the following:

"... [The Picture Formats List] says bit 15 of the color map vector
must be zero. I've encountered quite a few files where [bit 15] is
set (with no associated palette entry)..."

<Spectrum 512 (Smooshed)> *.SPS

This format compresses Spectrum 512 pictures better than the standard
method. There are at least two programs that support this format, SPSLIDEX
and ANISPEC, although the two seem to differ slightly in their interpretation
of the format.
One point of interest: Shamus McBride deciphered this format without an ST!

1 word 5350 (hex) ("SP")
1 word 0 (reserved for future use)
1 long length of data bit map
1 long length of color bit map
<= ? bytes compressed data bit map
<= ? bytes compressed color bit map

< ? bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme,
similar to that used in Spectrum Compressed (*.SPC) pictures.

The data map is stored as a sequence of records. Each record consists of a
header byte followed by one or more data bytes. The meaning of the header
byte is as follows:

For a given header byte, x (unsigned):

0 <= x <= 127 Use the next byte x + 3 times
128 <= x <= 255 Use the next x - 128 + 1 bytes literally
(no repetition)

There are two kinds of *.SPS files.

The data may appear in the same order as *.SPC files (SPSLIDEX format?):

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

The second variant (ANISPEC format?) encodes the data as byte wide vertical
strips:

Picture data, bit plane 0, scan line 1, columns 0 - 7.
Picture data, bit plane 0, scan line 2, columns 0 - 7.
Picture data, bit plane 0, scan line 3, columns 0 - 7.
. . .
Picture data, bit plane 0, scan line 199, columns 0 - 7.
Picture data, bit plane 0, scan line 1, columns 8 - 15.

```
Picture data, bit plane 0, scan line 2, columns 8 - 15.
. . .
Picture data, bit plane 0, scan line 199, columns 312 - 319.
Picture data, bit plane 1, scan line 1, columns 0 - 7.
. . .
Picture data, bit plane 3, scan line 198, columns 312 - 319
Picture data, bit plane 3, scan line 199, columns 312 - 319.
```

A for loop to process that data would look like

```
for (plane = 0; plane < 4; plane++)
for (x = 0; x < 320; x += 8)
for (y = 1; y < 200; y++)
for (x1 = 0; x1 < 8; x1++)
image[y, x + x1] = ...
```

Color map compression:

Color map compression is similar to *.SPC color map compression, but the map is compressed as a string of bits, rather than words. There are 597 records (one for each palette). Each record is composed of a 14-bit header followed by a number of 9-bit palette entries. The 14-bit header specifies which palette entries follow (1 = included, 0 = not included). The most significant bit of the header refers to palette entry 1, while the least significant bit refers to palette 14. Palette entries 0 and 15 are forced to black (zero). Each palette entry is encoded as "rrrgggbbb".

The format of the palette is described above in the section on uncompressed Spectrum pictures (*.SPU).

<Art Director> *.ART (low resolution only)

```
16000 words picture data (screen memory)
16 words palette
15 * 16 words 15 more palettes for animation
-------------
32512 bytes total
```

<C.O.L.R. Object Editor Mural> *.MUR (low resolution only)

```
16000 words picture data (screen memory)
(palettes are stored in separate files)
-----------
32000 bytes total
```

<Doodle> *.DOO (high resolution only)

```
16000 words picture data (screen memory)
-----------
32000 bytes total
```

<Cyber Paint Sequence> *.SEQ (low resolution only)

This format, while fairly complex, yields excellent compression of animated images while offering reasonably fast decompression times.

```
1 word magic number [$FEDB or $FEDC]
1 word version number
1 long number of frames
1 word speed (high byte is vblanks per frame)
118 bytes reserved
---------
128 bytes total for .SEQ header

for each frame {
1 word type (ignored?)
1 word resolution [always 0]
16 words palette
12 bytes filename [usually " . "]
1 word color animation limits [not used]
1 word color animation speed and direction [not used]
1 word number of color steps [not used]
1 word x offset for this frame [0 - 319]
1 word y offset for this frame [0 - 199]
1 word width of this frame, in pixels (may be 0, see below)
1 word height of this frame, in pixels (may be 0, see below)
1 byte operation [0 = copy, 1 = exclusive or]
1 byte storage method [0 = uncompressed, 1 = compressed]
1 long length of data in bytes (if the data is compressed, this
will be the size of the compressed data BEFORE decompression)
60 bytes reserved
--------
128 bytes total for frame header

? bytes data
}
```

Frames are "delta-compressed," meaning that only the changes from one frame to the next are stored. On the ST, .SEQ files are always full-screen low resolution animations, so the sequence resulting from expanding all the data will be n 320 by 200 pixel low resolution screens, where n is given in the .SEQ header.

Since only the changes from frame to frame are stored, image data for a frame will rarely be 320x200 (except for the very first frame, which will always be a full screen). Instead what is stored is the smallest rectangular region on the screen that contains all the changes from the previous frame to the current frame. The x offset and y offset in the frame header determine where the upper left corner of the "change box" lies, and the width and height specify the box's size.

Additionally, each "change box" is stored in one of five ways. For each of these, the screen is assumed to have the full-screen image from the last frame on it.

o uncompressed copy: The data for this frame is uncompressed image data, and is simply copied onto the screen at position (x, y) specified in the frame header.

o uncompressed eor: The data for this frame is exclusive or'ed with the screen at position (x, y).

o compressed copy: The data for this frame must be decompressed (see below), and then copied onto the screen at position (x, y) specified in the frame header.

o compressed eor: The data for this frame must be decompressed (see below), and then exclusive or'ed with the screen RAM at position (x, y).

o null frame: The width and/or height of this frame is 0, so this frame is the same as the previous frame.

Of the 5 methods above, the one that results in the smallest amount of data being stored for a particular is used for that frame.

Compression Scheme:

Compression is similar to that employed by Tiny, but is not quite as space-efficient.

Control word meanings:

For a given control word, x:

x < 0 Absolute value specifies the number of unique words to take from the data section (from 1 to 32767).
x > 0 Specifies the number of times to repeat the next word taken from the data section (from 1 to 32767).

Note that a control word of 0 is possible but meaningless.

Format of expanded data:

The expanded data is not simply screen memory bitmap data; instead the four bitplanes are separated, and the data within each bitplane is presented vertically instead of horizontally. (This results in better compression.)

To clarify, data for a full screen would appear in the following order:

```
bitplane 0, word 0, scanline 0
bitplane 0, word 0, scanline 1
...
bitplane 0, word 0, scanline 199
bitplane 0, word 1, scanline 0
bitplane 0, word 1, scanline 1
...
bitplane 0, word 1, scanline 199
...
bitplane 0, word 79, scanline 199
bitplane 1, word 0, scanline 0
...
```

bitplane 3, word 79, scanline 199

Note however, that the data does not usually refer to an entire screen, but
rather to the smaller "change box," whose size is given in the frame header.

<Animatic Film> *.FLM (low resolution only)

1 word number of frames
16 words palette
1 word speed (0 - 99; value is 99 - # vblanks to delay between frames)
1 word direction (0 = forwards, 1 = backwards)
1 word end action (what to do after the last frame)
0 = pause, then repeat from beginning
1 = immediately repeat from beginning
2 = reverse (change direction)
1 word width of film in pixels
1 word height of film in pixels
1 word Animatic version number (major) [< 2]
1 word Animatic version number (minor)
1 long magic number 27182818 (hex)
3 longs reserved for expansion (should be all zeros)
----
32 words total for header

? words image data (words of screen memory) for each frame, in order

<Animaster Sprite Bank> *.ASB (low resolution only)

1 word number of frames - 1
1 word ?
1 byte maximum width, in pixels
1 byte maximum height, in pixels
16 words palette
----
38 bytes total for header

For each frame {
1 word width of this frame (in pixels) - 1
1 word height of this frame (in pixels) - 1
1 word ?
? words image data (words of screen memory)
}

<STOS> *.MBK

9 words ?
1 long $19861987 (magic number?)
1 long offset from this long to header for low resolution
parameter block (if past end of file, no low res frames)
1 long offset from this long to header for med resolution
parameter block (if past end of file, no med res frames)
1 long offset from this long to header for high resolution
parameter block (if past end of file, no high res frames)

```
1 word number of low resolution frames
1 word number of medium resolution frames
1 word number of high resolution frames

For each frame {
1 long offset to data (probably only used internally by STOS)
1 byte width in words (multiply by 16 to get width in pixels)
1 byte height in pixels
1 byte X hotspot location
1 byte Y hotspot location
}

(The format implies other stuff could be here.)

1 long ["PALT" $50414C54]
16 words palette

? words of data for each frame, in the order mentioned in the
header. Monoplanar mask data follows image data for each frame.
----------
? words total

The frames often seem to be in semi-random order, not necessarily in
the order they are to be animated.

<GEM Bit Image> *.IMG

1 word version number of image file [1]
1 word length of header in words [usually 8]
1 word number of color planes [1 for monochrome]
1 word pattern length in bytes [1-8, usually 2 for screen images]
1 word pixel width in microns (1/1000 mm, 25400 microns per inch)
1 word pixel height in microns
1 word line width in pixels
1 word number of lines
-------
? words header length defined in 2nd word of header

? bytes data

NOTES: If the image is a color image (planes > 1), the planes are stored
separately starting with plane 0. There is, however, no standard way of
storing the color palette. Some programs may save the palette in separate
files, some may extend the header. For this reason, you should never
assume the header is 8 words long, always get the header length from the
2nd word of the header. Also, the line width in the 7th word is the number
of pixels in a line. Since the data is encoded in byte-wide packets, the
actual unpacked line width is always a multiple of 8, and may be 1-7 pixels
longer than the length specified in the header.

For each byte x in the data section,

x = 0 Pattern/scanline run.
Read the next byte, n (unsigned).
```

If n > 0 then:
Read a number of bytes equal to the "pattern
length" word in the header. Repeat this
pattern n times.

If n = 0 then:
Scanline run. Data for the next scanline
is to be used multiple times. Read the
following record:

1 byte flag byte [$FF]
1 byte number of times to use
next scanline data

The data for the next scanline follows,
compressed normally.

x = 80 (hex) Uncompressed bit string. The next byte
determines the number of bytes to use
literally. The literal data bytes follow.

otherwise Solid run. The value of x determines
what to draw. The high bit specifies whether
the pixels are set or cleared. A 1 indicates
a byte-run using $FF, a 0 indicates a byte-run
using $00. The low 7 bits, taken as an unsigned
quantity, specify the length of the run in bytes.

<STAD> *.PAC (high resolution only)

4 bytes "pM86" (vertically packed) or "pM85" (horizontally packed)
1 byte id byte
1 byte pack byte (most frequently occuring byte in bitmap)
1 byte "special" byte
----
7 bytes total for header

? bytes data

The data is encoded as follows. For each byte x in the data section:

x = id byte Read one more byte, n. Use pack byte
n + 1 times.
x = "special" byte Read two more bytes, d, and n (in order).
Use byte d n times.
otherwise Use byte x literally.

<Imagic Film/Picture> *.IC1 (low resolution)
*.IC2 (medium resolution)
*.IC3 (high resolution)

4 bytes "IMDC"
1 word resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
1 word date (GEMDOS format)

```
1 word time (GEMDOS format)
8 bytes name of base picture file (for delta compression), or zeroes
1 word length of data (?)
1 long registration number
8 bytes reserved
1 byte compressed? (0 = no, 1 = yes)

If compressed {
1 byte delta-compressed? (-1 = no, > -1 = yes)
1 byte ?
1 byte escape byte
}
-------
65 bytes total for header (68 bytes if compressed)

? bytes data

Compressed data may be either stand-alone or delta-compressed (relative
to the base picture named in the header). Delta compression involves
storing only how the picture differs from the base picture (i.e., only
portions of the screen that have changed are stored). This is used to
to encode animated sequences efficiently.

Compressed data, stand-alone:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 2, use the next byte n times.
If n = 1, keep reading bytes until a
byte k not equal to 1 is encountered.
Then read the next byte d.
If the number of 1 bytes encountered is o,
use d (256 * o + k) times. I.e.,

if (n == 1) {
o = 0;
while (n == 1) {
o++;
n = next byte;
}

k = n;
d = next byte;

Use d (256 * o + k) times.
}
else {
d = next byte;
Use d (n) times.
}

x != escape byte Use x literally.
```

Compressed data, delta compressed:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 3, use the next byte n times.
If n = 1, do the same as for n = 1 in
stand-alone compression (above).
If n = 2, then set n = next byte.
If n = 0, end of picture.
If n >= 2, take n bytes from base
picture.
If n = 1, do the same as for n = 1
in stand-alone compression (above),
but take (256 * o + k) bytes from
base picture.

x != escape byte Use x literally.

<IFF Format> *.IFF

4 bytes "FORM" (FORM chunk ID)
1 long length of file that follows
4 bytes "ILBM" (InterLeaved BitMap file ID)

4 bytes "BMHD" (BitMap HeaDer chunk ID)
1 long length of chunk [20]
20 bytes 1 word = image width in pixels
1 word = image height in lines
1 word = image x-offset [usually 0]
1 word = image y-offset [usually 0]
1 byte = # bitplanes
1 byte = mask (0=no, 1=impl., 2=transparent, 3=lasso)
1 byte = compressed [1] or uncompressed [0]
1 byte = unused [0]
1 word = transparent color (for mask=2)
1 byte = x-aspect [5=640x200, 10=320x200/640x400, 20=320x400]
1 byte = y-aspect [11]
1 word = page width (usually the same as image width)
1 word = page height (usually the same as image height)

4 bytes "CMAP" (ColorMAP chunk ID)
1 long length of chunk [3*n where n is the # colors]
3n bytes 3 bytes per RGB color. Each color value is a byte
and the actual color value is left-justified in the
byte such that the most significant bit of the value
is the MSB of the byte. (ie. a color value of 15 ($0F)
is stored as $F0) The bytes are stored in R,G,B order.

4 bytes "CRNG" (Color RaNGe chunk ID)
1 long length of chunk [8]
8 bytes 1 word = reserved [0]
1 word = animation speed (16384 = 60 steps per second)

1 word = active [1] or inactive [0]
1 byte = left/lower color animation limit
1 byte = right/upper color animation limit

4 bytes "CAMG" (Commodore AMiGa viewport mode chunk ID)
1 long length of chunk [4]
1 long viewport mode bits (bit 11 = HAM, bit 3 = interlaced)

4 bytes "BODY" (BODY chunk ID)
1 long length of chunk [# bytes of image data that follow]
? bytes actual image data

NOTES: Some of these chunks may not be present in every IFF file, and may not be in this order. You should always look for the ID bytes to find a certain chunk. All chunk IDs are followed by a long value that tells the size of the chunk (note that "ILBM" is not a chunk ID). This is the number of bytes that FOLLOW the 4 ID bytes and size longword. The exception to this is the FORM chunk. The size longword that follows the FORM ID is the size of the remainder of the file. The FORM chunk must always be the first chunk in an IFF file.

The R,G,B ranges of AMIGA and ST are different (AMIGA 0...15, ST 0...7), as is the maximum number of bitplanes (AMIGA: 5, ST: 4).

Format of body data

An expanded picture is simply a bitmap. The packing method is PackBits (see below), and is identical to MacPaint and DEGAS Elite compressed.

The (decompressed) body data appears in the following order:

line 1 plane 0 ... line 1 plane 1 ... ... line 1 plane m
[line 1 mask (if appropriate)]
line 2 plane 0 ... line 2 plane 1 ... ... line 2 plane m
[line 2 mask (if appropriate)]
...
line x plane 0 ... line x plane 1 ... ... line x plane m
[line x mask (if appropriate)]

The FORM chunk identifies the type of data:

"ILBM" = interleaved bit map
"8SVX" = 8-bit sample voice
"SMUS" = simple music score
"FTXT" = formatted text (Amiga)

<MacPaint> *.MAC

1 long version number [0=ignore header, 2=header valid]
38 * 8 bytes 8x8 brush/fill patterns. Each byte is a pattern row, and the bytes map the pattern rows top to bottom. The patterns are stored in the order they appear at the bottom of the MacPaint screen top to bottom, left to right.
204 bytes unused

```
-------------
512 bytes total for header

< 51200 bytes compressed bitmap data
-------------
< 51712 bytes total
```

NOTE: The version number is actually a flag to MacPaint to indicate if the brush/fill patterns are present in the file. If the version is 0, the default patterns are used. Therefore you can simply save a MacPaint file by writing a blank header (512 $00 bytes), followed by the packed image data.

Bitmap compression:

The bitmap data is for a 576 pixel by 720 pixel monochrome image. The packing method is PackBits (see below). There are 72 bytes per scan line. Each bit represents one pixel; 0 = white, 1 = black.

<RGB Intermediate Format> *.RGB (low resolution only)

This format was invented by Lars Michael to facilitate conversions between standard ST picture formats and higher resolution formats like GIF and IFF. It supports 12 bits of color resolution by keeping the red, green and blue components in separate bit planes.

```
1 word resolution (ignored)
16 word palette (ignored)
16000 words red plane (screen memory)
1 word resolution (ignored)
16 word palette (ignored)
16000 words green plane (screen memory)
1 word resolution (ignored)
16 word palette (ignored)
16000 words blue plane (screen memory)
------------
96102 bytes total
```

The format was derived by concatenating three DEGAS .PI1 files together -- one for each color gun. The RGB value for a pixel is constructed by looking at the appropriate pixel in the red plane, green plane, and blue plane. The bitplanes are in standard ST low resolution screen RAM format, but where pixel values in screen RAM refer to palette entries (0 through 15), pixel values here correspond to absolute R, G, and B values. The red, green, and blue components for each pixel range from 0 to 15 (4 bits), yielding a total of 12 bits of color information per pixel. Not coincidentally, this is exactly the format of ST palette entries (although on ST's without the extended palette only the lower 3 bits of each color component are used).

You can view a single bit plane on a standard ST by splitting the .RGB file into its three DEGAS .PI1 components and setting the palette to successively brighter shades of gray.

<ComputerEyes Raw Data Format> *.CE1 (low resolution)
*.CE2 (medium resolution)

1 long [$45594553 or "EYES"]
1 word resolution [0 = low res, 1 = medium res]
8 words ?
If resolution = 0 {
64000 bytes red plane, 320 x 200, 1 pixel per byte
64000 bytes green plane, 320 x 200, 1 pixel per byte
64000 bytes blue plane, 320 x 200, 1 pixel per byte

192022 bytes total
}
else If resolution = 1 {
128000 words 640 x 200, 1 pixel per word

256022 bytes total
}

This is almost two formats in one:

Low resolution:

The planes are arranged vertically, instead of horizontally.
The first byte is the red component of pixel (0,0), the second is (0,1),
and the third (0,2). The 201st corresponds to (1,0), etc. The 64001st
byte is the green component of (0,0).
Only the low six bits of each byte are used.

Medium resolution:

The picture is arranged vertically, instead of horizontally.
The first word is pixel (0,0), the second is (0,1), and the third
(0,2). The 200th is (1,0) etc.
Each word is divided up into the RGB values for the corresponding
pixel, as follows:

Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 B4 B3 B2 B1 B0 G4 G3 G2 G1 G0 R4 R3 R2 R1 R0

Bit 15 is not used.

<PackBits Compression Algorithm>

The following packing algorithm originated on the Mac, was adopted by
Electronic Arts/Commodore for use in the IFF standard, and then by Tom
Hudson for use in DEGAS Elite. The algorithm is currently used in
MacPaint, IFF, and DEGAS Elite compressed file formats. Each scan line
is packed separately, and packing never extends beyond a scan line.

For a given control byte 'n':
0 <= n <= 127 : use the next n + 1 bytes literally (no repetition).
-127 <= n <= -1 : use the next byte -n + 1 times.
n = -128 : no operation, not used.

---

* Roland Waldi contributed extensive information on the following formats:

GEM, IMG, Doodle, STAD, Imagic Film/Picture, Art Director, IFF

** John Brochu, ST picture formats guru, provided sage advice and many corrections to the following formats:

NeoChrome, DEGAS Elite Compressed, Spectrum 512 Compressed,
GEM Bit Image, IFF, MacPaint

783. Looking for software

Newsgroup: comp.sys.atari.st
Date: 1991-06-27 04:28:37 UTC
From: system@n6vbg.hamavnet.com
Message-ID: <1991Jun26.212837.3@n6vbg.hamavnet.com>
Source record: 230815

Hello, good people,

I am looking for a used copy of the Atari Flight Simulator, complete with manuals and all.

If someone has this package, and want to part with it, please contact me to system@n6vbg.hamavnet.com.

Thanks,

Javier

784. Re: Possible GCR sale... What is the real value of a Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1991-06-27 05:36:50 UTC
From: sytang@lamar.ColoState.EDU
Message-ID: <15734@ccncsu.ColoState.EDU>
Source record: 230803

Although Mac plus ROM is not as easy to find as last year, If one post a wanted message in comp.sys.mac.wanted still possible to find a set for about $100 to $150.(There is a set going now for bid >$90 in there) The only thing is get the ROM first then buy the Spectre.
As system 7 goes, even a lot of Mac add on accerlator has trouble with it, one of the Mac developer that I know has a SE with 030 board crash with system 7. plus without 030 or PMMU, there is not much advantage to jump except probably the true type font. And to run true type font does not require system 7, the 6.0.7 can handle true type font,only need to get the true type font init from the ftp.apple.com located in a file call personal-laserwriter-tool.sit (the actural name might be silcely off, it's the new laser writer Apple introduced eariler) and get the true type fonts from the same place in the other file call true-type-font****.sit.hqx
Under GCR, you don't need the superdrive to import PC(or STE)files. Run the apple file exchange from the Mac mode then insert the PC disk. The directory of the PC disk will show up in the file exchange dialog box and ready for you to transfer to Mac or vise versa.(Better then Mac SE).

ONM07@DMSWWU1A.BITNET (Julian F. Reschke) writes:

>It contains all information you need about TOS and GEM (well, I HOPE so...),
>including all new features up to TOS versions 2.05 and 3.05. The second half
>of the book contains lots of technical details about the hardware (again
>including the STE/Mega STE and TT hardware; SCC, SCSI and so on).

It sounds like a great resource! If you are able (and allowed) to provide complete information on the mysterious GAL chips, it would be a relief. Instructions about the VME bus is needed and an indepth review of Atari Unix would be welcomed too.

I'll get it in whatever language available, although most of my knowledge of German comes from watching the interesting ITV shows, "Derrick" and "Drei Damen Von Grille" (Three Ladies and their Wiener Mobile).

>The price will be DM 89.- oder 99.-. And yes, we (the authors) and Sybex
>*ARE* interested in translations. Please contact Sybex U.S. or an other
>US book company, if you are _really_ interested that this will be done.

The person to contact at Sybex US is Diane King. She said that they are open to suggestions, so if everyone gives her a friendly call, it could favorably influence her decision to commission a translation.

Someone mentioned that there were software-based German-to-English translators so maybe that method can be tried. Does anyone has experience with them?

The following is a list of all the Sybex divisions. People outside of US might want to express their desire for the book/translated editions by calling their nearest sales representative and request that they contact Diane King at Sybex USA, so that she may gauge the depth of interest world-wide.

I thought it were SPectrum 512 Sequences, i.e. films like the .GL files in the PC area. BTW is there a possibility to convert .GL to .SPS? Perhaps by converting the single images and then re-linking them? Are there programs to rip .GL files into .GIF and to combine .SPC or .SPU to .SPS? Which System, Atari or MesS-DOS?

No, no sequences. Here is an extract of Dave Baggetts ST picture
formats list:

---------- CUT HERE ------------------

...

<Spectrum 512 (Smooshed)> *.SPS

This format compresses Spectrum 512 pictures better than the standard
method. There are at least two programs that support this format, SPSLIDEX
and ANISPEC, although the two seem to differ slightly in their interpretation
of the format.
One point of interest: Shamus McBride deciphered this format without an ST!

1 word 5350 (hex) ("SP")
1 word 0 (reserved for future use)
1 long length of data bit map
1 long length of color bit map
<= ? bytes compressed data bit map
<= ? bytes compressed color bit map

< ? bytes total

...

---------- CUT HERE ------------------

Hope this ends the discussion,

Lars

Grin :-).

24 bit color doesn't make a better machine but since most people don't realize they are not gonna need it they think they need it and might let it make some sort of effect on them.

Four colors is fine for everything I do; just let me choose them from a sufficiently large pallete, and I'm happy. Oddly enough, 4096 colors is a sufficiently large pallete. (now, 700x500 isn't enough bits, but multiple virtual screens go a long way towards solving that).

On the other hand, take away my ability to pop open new CLI to terminate a CPU runaway, and I'll be upset. Maybe it's because I started by playing with multitasking systems instead of monotasking systems, but not having worry about whether I can start application X while application Y is running for all applications X and Y seems like an important feature to me.

If you don't do what I do (not unlikely), and actually need 24 bit color, and don't want multitasking - that's fine. Choose the computer that's best for you. Don't tell me I didn't choose the best computer because I chose one that meets my needs better than what you chose, though.

Whatever the advantages of LHArc 1.1321 might be (faster?), it does solve
the problem of those many incompatible LHarcs. Using LHarc of whatever
version could only under the following conditions be tolerated:

- There is only one LHarc version at a time.
- The source code is maintained by a single person or team.
- The source code is completely written in C (no assembly
"optimizations").
- The source code is suitable for most (better: all) machines and
operating systems.

Add to Rainer's list:

- The source code and executable code should be Public Domain (ie. no calls for Shareware fees involved)

One of the reasons I despise most of the LHarc versions is that their authors are trying to make a buck while they introduce incompatibilities. (The author of xlharc 1.2 excluded from this list...)

>If you like, you can work without GEM on your ST today. Just place a
>command shell into your AUTO folder. Isn't MiNT meant just for purposes
>like these?

Yes, I've used this. Trouble is, I want to be working with non-GEM and GEM
programs. On a 68000 there is not _very_ much available memory space. Because
there is (almost) no distinction made between user and supervisor spaces
and because code=data space, it is not possible to get a full 16 MB of user
RAM. Therefore the ROM and RAM must compete for available address ranges.
When GEM is running, there is space taken by the GEM variables and data
structures. So far it has not been possible to deinitialise GEM and reclaim
this space without a reset. If GEM is in ROM, the space taken by the GEM code
cannot be reclaimed either. 256k might not be considered very much memory
any more but it's enough for one more full-blown application process or
for one of the non-GEM applications to handle more data in memory at once.

>The current TOS versions cannot handle a physical sector size of 1024
>bytes. It's not unreasonable to suppose that this won't ever find its
>way into TOS again due to compatibility problems.

Conceptually there is the same problem with supporting HD floppies.
In the one case it can be fixed in hardware, in the other case it needs
a software fix. In either case the newer format cannot be used by the
older machine without modification.

>It isn't even sure that new machines will have a 1772 built-in
>that offers such capabilities.

Maybe not, but we can be reasonably sure that any typical FDC will be
able to handle several sector sizes, including 1024-byte.

>As I stated a while ago, I tested a third-party floppy driver some time
>ago which offered 1024-bytes-per-sector support.

Is this available anywhere? I simply don't have the time right now to write
my own floppy driver, but would like to move to this format.

>>Optimisation could be made almost automatic, the only handwork necessary

>>are in some way critical.
>
>The time-critical sections are already written in assembler, especially
>the BIOS and the lower screen driver routines. They could and should
>be faster, however.

Yes, and some parts of the assembler generated code will need to be protected from the optimiser. Even in 1.62 there are software timing loops. There might also be certain race conditions which must be avoided.

About a possible RAM-based GEM. Is it not reasonable to have a GEM which allocates its data memory somewhere other than below the TPA base address? This would seem to offer more flexibility in initialising and removing GEM (maybe several times) during the same work session.

Much more address range is "wasted" by the generous hardware register
assignments. No, I don't think this is a serious restriction. At least,
I don't know a single application that would run on a 1 MB ST without
GEM and doesn't because GEM installs its own data areas. It wouldn't be
bad to reclaim the space GEM allocated for itself, but I think there are
lots of other, more important things in TOS that should be improved
before this.

>>The current TOS versions cannot handle a physical sector size of 1024

The difference is: DOS machines won't understand 1024-byte-sectors.
And file system compatibility has always been of some importance
for Atari, as it seems.

>>As I stated a while ago, I tested a third-party floppy driver some time
>>ago which offered 1024-bytes-per-sector support.

>Is this available anywhere? I simply don't have the time right now to write
>my own floppy driver, but would like to move to this format.

Not yet - as far as I know. I don't know what the author did with it.

>Yes, and some parts of the assembler generated code will need to be protected
>from the optimiser. Even in 1.62 there are software timing loops. There might
>also be certain race conditions which must be avoided.

Even TOS 3.01 seems to have timing loops. When moving TOS 3.01 to TT-RAM,
thus speeding it up by 20 to 40 percent, sometimes you get problems
when reading and writing HD disks ("data corrupted" alerts and the like).
I think this is due to some tight timing loops that break in the fast
part of RAM.

>About a possible RAM-based GEM. Is it not reasonable to have a GEM which
>allocates its data memory somewhere other than below the TPA base address?
>This would seem to offer more flexibility in initialising and removing GEM

Most of the memory GEM uses is malloc()'ed just like any other memory block.

Great! This is comp.sys.atari.st not comp.sys.amiga.*
and these little battles and irritating posts do NOT belong here. Who is in charge of this news group anyway?

Nobody. That's the way usenet works.

However, you've got some nitwit Atari user (no, not all Atari users are nitwits; this one is, though) who's made an obvious attempt to start wars in many (all?) the Amiga groups. He wasn't even bright enough to crosspost, but posted the same mesage to every group I read, and presumably to all of them. You can seen the message below.

I've already sent him a note to discourage such behavior. You might do it also. If nothing else, it's had the bad effect of causing me to poke around in (and post to) an st group.

BTW, I'm not a life-long Commodore fan. The Amiga 3000 is the first machine to come from CBM that I actually thought was worth spending money on.

Now, I'll go send a note to to Thomas Hill to discourage him from dropping turds in your group.

797. Wanted: 1st Word+ p/driver for KXP-1124

Newsgroup: comp.sys.atari.st
Date: 1991-06-27 18:10:33 UTC
From: D.B.Barratt@newcastle.ac.uk
Message-ID: <1991Jun27.181033.1453@newcastle.ac.uk>
Source record: 230839

Hi,

Does anyone know where I can get hold of a 1st Word+ priner driver
for a Panasonic KXP-1124.

Please e-mail any response.

Cheers,

Dave

>
>A 24-bit card with complete screen drivers for all the applications you have?
>I doubt that.

Why on earth would you run a word processor or shell in 24bits? EVen if
the Amiga had 24bit graphics built in I wouldn't run my Workbench on it
because it would slow down ALL screen rendering to a sluggish
halt without a something like a 34010 onboard. Instead, I'd have
the Word processor and GUI set to 8 or 16 colors (3d look) and the paint
program on another screen set to 24bit. All the current Amiga graphic
cards work with the OS because they are still using the custom chips
for their tricks. HAM-E and DCTV work with all paint programs and all
displayer programs. (even things like AmigaVision authorware)

>> Besides, if you have a problem with your 500, you FedEx it back to
>>Commodore (at CBM's expense) & it's promptly replaced or repaired & sent back.

>You must be kidding. At least here in Germany, nobody cares when your A2000
>breaks down. Especially Commodore won't care.

In the US FedEx will come to your house, pick up your computer, and
repair it quickly. For A3000's someone comes to your house (onsite
repair). What other countries do is different since each Commodore
sub-company has different policies. Does Atari even exist in the US?

>> I've seen the so-called blitter on an ST. I was not impressed. The

>is something like a blitter and therefore uses it much more than TOS.

Yes, it's better integrated on the Amiga, and shared nicely as is
alll resources on the Amiga.

>> Of course, for about $10 (probably less) you can pop a 68010 into your
>>Amiga & make up for that difference. Unless Atari has finally released a
>>non-TT TOS version that supports 680(1+)0 chips, ST owners don't have this

>
>Sigh. We've had cooperative multitasking from the start. Applications
>and accessories can send messages to each other. And I don't think the
>Workbench is much of a real GUI - not before Kick 2.0, at least.

Intuition is the GUI, workbench is the file/finder system (e.g. like
Finder on the Mac). I never used workbench before 2.0, but I haven't seen
many Atari users who used GEM either. GEM doesn't look too hot on that
lo-res screen.

>> Workbench is just as easy to use as any most other GUIs. Double click
>>the icon & away you go...
>
>Just try to view all files in a folder with the standard workbench.
>You won't get them. Instead, you have to confine yourself to a command
>shell. That's not the way GUIs were meant to work.

You do in 2.0. There are _numerous_ workbench replacements/enhancements
out there. But 2.0 beats the pants off all of them. (2.0 kicks the
stuffings out of GEM too)

>processes mentioned are equivalents of TSRs. CpuBlit is a text output
>speeder (BTW, interesting to know that you're using CpuBlit while
>you're claiming that your blitter is much faster than a ST blitter).
That's because the poster probably has an A3000 with a 68030. CPUBlit
ONLY gives a speed increase on the maximum resolution screens and only
for things like text rendering. It would slow down massively trying to do what
the blitter does (like combine 3 DMA channels of data using one of the
256 logic operations, plus masking ans shifting, and filling the pattern.)
The key phrase here is "parallel processing". Letting the blitter
do something takes the load off the CPU.

>DMouse is a screen saver/mouse speeder package. Virus_Checker is also
>of the TSR type. If you think about it, you'll see that the list
>above was no good example for real multitasking. When working with
>my ST/TT, I have at least that many processes and resident programs in
>my computer.

But TSR's don't share the CPU, one of them runs until it completes
it processing and then the next one does. The more of them you have
running in an interupt/os patch routine the more sluggish the computer
will get. You should never hog interupts. TSR's on the Amiga under 2.0
are done using commodities.exchange which allows you to set up handlers in
the input.device that watch for certain hot-keys/events. While they are
waiting, they are taking ZERO cpu time.
How about what I am doing now? Right now I have a terminal loaded,
in the background I have lharc unarcing some gif pictures I downloaded
earlier which are passing the output names to a script which runs them through
GIF->IFF. Meanwhile, I have 2 shells open and one of them is running
a corewars simulator which is battling two programs (mice vs mortar).
In addition to this, I am getting no visible slow down on my terminal
which is running at 19,200 baud on a USR HST.

>Don't get me wrong:
>I don't question the usefulness of preemptive multitasking. It's just

>I couldn't care less if my computer has 3 or 4 digital voices. It just
>doesn't matter. If you're making professional music, you can't make use
>of the home-computer bleep-style digital channels the STe and Amiga

Amiga channels don't bleep. They have 4 DMA channels to themselves,
8 bit sound, 4khz to 28khz. You can change the sampling rate on demand
and can attach DMA channel to have one channel module the volume and
frequency of the other (allows you to get synthesis effects)

>offer; instead, you will use MIDI devices (that's why the ST has a
>MIDI port built-in). If you're running standard applications, you don't need
>sound except the occasional beep when you've done something wrong.

Except when you run things like Amigavision or hypertext/authorware
applications where you want to combine animations with digitized sound.
For CDTV it's a nice addition, along with it's 16bit sound and it's MIDI
port.

>For your information: The STe/TT digital sound chip has an own DMA
>channel, just like the Amiga.

But does it have DMA for each channel? Can you change the DMA rate?
I heard the STe's DMA sound is fixed at one frequency/sampling rate and
can't change it.

>> Applied Engineering and Commodore both make Ami HD drives. The problem

>>This coprocessor, though, cannot handle the throughput speeds of high density
>>drives (twice that of the older drives), so workarounds have had to be found.
>
>To my knowledge, there is no HD drive for the Amiga that handles standard
>MFM disks. A real pain when shuffling data to a PC.

The new HD drive on the A3000 has 3 modes. 880k, 1.44mb, and 1.76mb.
1.44mb mode was the main reason for making it. You can also buy
$200 SCSI floppy drives.

>> No? Why not? That .86 MHz doesn't make much of a difference... especially
>>if the ST also has to use the CPU to do I/O and/or graphics stuff at the same
>>time. Oops! Forgot again... no multitasking. Never mind.
>
>See above. The floppy controller and the ACSI bus have an own DMA channel.
>In the TT, there is a second SCSI DMA channel.

The A3000 has 32-bit for it's harddrive , and it normally gets
xfer rates of up to 2mb/second (and this only eats 5% of the CPU time
while doing it.) The Amiga has over 25 DMA channels. The A3000 now has
8 integrated custom chips to handle them.

>> If I remember the TT specs correctly, the only grahics mode the TT has
>>that can outdo a stock Amiga 3000 (or any other model, if it weren't for the

>>amiga can do 1008x800 (1008x1024 in PAL mode) mono.
>
>1280x960. 72 Hz. Without a special graphic card. IMHO, a big advantage and
>one of the reason why I bought a TT.

(A2024) 1024x1024 PAL on the Amiga without a graphic card, just need a nice
monitor. (The 1024x1024 also has 4 grey colors for the 3d GUI look)
With Commodore's A2410 you get up to 1024x1024 with 256 colors out of
16.7 million.

I was alluding to the fact that there is no real gfx standard for
the Amiga right now. Much like the situation in the PC world. I think
having a general scheme for implementing graphic card drivers is a
definitive plus for an OS - the ST's VDI allows just this.

> In the US FedEx will come to your house, pick up your computer, and

Admittedly, this is good service. No doubt about that. I'm
impressed.

> And the ST doesn't gain much from running at a _slightly_ faster
>processor speed.

I didn't claim that. But remember that it's not only the 10% clock
difference that makes CPU-intensive jobs on the Amiga slower. You must
take the video hardware into account which costs additional cycles.

> Intuition is the GUI, workbench is the file/finder system (e.g. like
>Finder on the Mac). I never used workbench before 2.0, but I haven't seen

The new workbench is clearly better. But we were discussing the former
version and the philosophy behind it.

> That's because the poster probably has an A3000 with a 68030. CPUBlit
>ONLY gives a speed increase on the maximum resolution screens and only

>for things like text rendering. It would slow down massively trying to do what

I know, I've read the CpuBlit docs.

>The key phrase here is "parallel processing". Letting the blitter
>do something takes the load off the CPU.

Right you are. I didn't like the fact that the original poster
overemphasized the importance of a blitter in general. I don't
question that it's useful - but it's not what makes or breaks a
computer.

> How about what I am doing now? Right now I have a terminal loaded,
>in the background I have lharc unarcing some gif pictures I downloaded

>In addition to this, I am getting no visible slow down on my terminal
>which is running at 19,200 baud on a USR HST.

Likewise, I didn't say multitasking is a no-no. I would like to have
it here (besides: I can have it on my machine, though not officially
by Atari). The original poster just gave a bad example for its usage.

> Amiga channels don't bleep. They have 4 DMA channels to themselves,
>8 bit sound, 4khz to 28khz. You can change the sampling rate on demand
>and can attach DMA channel to have one channel module the volume and
>frequency of the other (allows you to get synthesis effects)

I know all this. I've read the hardware manuals. The new STe/TT
sound hardware is similar in may respects - but it still bleeps,
just like the Amiga does. At least when you're talking about
professional music!

> Except when you run things like Amigavision or hypertext/authorware
>applications where you want to combine animations with digitized sound.
>For CDTV it's a nice addition, along with it's 16bit sound and it's MIDI
>port.

It's _nice_ to have it, I agree upon that. But I don't need it. That's
why I bought the ST and the TT instead of an Amiga.

> But does it have DMA for each channel? Can you change the DMA rate?
>I heard the STe's DMA sound is fixed at one frequency/sampling rate and
>can't change it.

That's wrong. I didn't delve into the details yet, but I'm sure there
is more than just one sampling rate.

> The new HD drive on the A3000 has 3 modes. 880k, 1.44mb, and 1.76mb.
>1.44mb mode was the main reason for making it. You can also buy
>$200 SCSI floppy drives.

Does it format standard MFM format so that every PC can read it?

> The A3000 has 32-bit for it's harddrive , and it normally gets
>xfer rates of up to 2mb/second (and this only eats 5% of the CPU time
>while doing it.) The Amiga has over 25 DMA channels. The A3000 now has

We know all that. What do you want to prove by that?

>(A2024) 1024x1024 PAL on the Amiga without a graphic card, just need a nice
>monitor. (The 1024x1024 also has 4 grey colors for the 3d GUI look)

From what I've heard, the 2024 is a monitor with special hardware
integrated in it that buffers screen frames and displays them at
quadruple the speed the Amiga sends it. This way, the Amiga sends
a forth of the whole screen in every screen frame, and the monitor
composes the complete picture. This means you have a real refresh rate
of 50Hz/4 or 60Hz/4. Not exactly what I would call "without a
graphic card".

>With Commodore's A2410 you get up to 1024x1024 with 256 colors out of

801. KWEST - ST meeting - Wed July 10/91

Newsgroup: comp.sys.atari.st
Date: 1991-06-27 21:06:46 UTC
From: daroloso@watmath.waterloo.edu
Message-ID: <1991Jun27.210646.14640@watmath.waterloo.edu>
Source record: 230830
Cross-posted to: uw.sys.atari,comp.sys.atari.st

KWEST, the Kitchener-Waterloo Eight Sixteen Thirty-two Atari user group,
holds its ST or 16-bit meeting on the second Wednesday of every month
in the DCS Course Room, Room 2009 which is on the 2nd floor
of the Math & Computer Building at the University of Waterloo.
Room opens at 7:00 pm. Meeting starts at 7:30 pm.

The next meetings are Wednesday, July 10, August 14, and September 11, 1991.

The first meeting is free.
Membership is $15 a year and is a family membership.

Our freeware/shareware library currently has over 215 disks and each member
gets a catalog disk which can be traded in for an update.
We sell copies of the library disks and the Disk-of-the-Month for $2 each.

We also have a newsletter "The Hard Copy" (I'm the editor) and distribute
AtariUser free to our members.

Below is the topic of our next meeting. August will be a Games/Library Night.

Dani Roloson
579-3695

Topic for ST meeting on Wednesday, July 10, 1991

TADS: The Text Adventure Development System

From: Dani A. Roloson

If you're interested in creating Infocom-like text-only adventures on your home
computer, TADS is a great start.
The package does all the parsing and defines most of the common adventure
verbs and item types in editable include files.

TADS is a shareware object-oriented programming tool for the Atari ST,
Macintosh, and IBM PC Compatible (MS-DOS/PC-DOS) which is available from
High Energy Software, P.O. Box 50422, Palo Alto, CA 94303.
(Atari users can try out the version available from the KWEST library.)

For my $25 US, I got the TADS Author's Manual, a sample game, updated versions
of the include files and programs, and a tool for combining
the game runner and game into a single file.

I am pleased with the quality of the manual, the response to the question I
asked with my payment, and the complexity and flexibility that
the package allows.

I would like to get together with other TADS users even on different platforms since a game written for the Atari can be compiled on all three systems.

Sample simple adventure:
****

```
#include <adv.t>
#include <std.t>

fireVerb: deepverb
verb = 'fire' 'shoot' 'blast'
sdesc = "fire"
doAction = 'Fire'
;

/* This is where you start the game. */
startroom: room
sdesc = "Hallway"
ldesc = "You are in the hallway. There is an room to the east. "
east = engineroom
;

engineroom: room
sdesc = "Engine Room"
ldesc = "You are in the engine room. The only exit is to the west. "
west = startroom
;

/* The engine can not be taken since it is a fixed item. */
engine: fixeditem
sdesc = "diesel engine"
ldesc = "It's an old-fashioned diesel engine. You can't imagine how it
runs this spaceship. "
location = engineroom
noun = 'engine'
adjective = 'diesel' 'old-fashioned' 'spaceship'
;

/* The slime gun starts out in your possession. */
slimegun: item
shotsleft = 6
sdesc = "slime gun"
ldesc = "It's standard equipment in the Denebian Space Patrol. "
location = Me
noun = 'gun' 'pistol' 'blaster'
adjective = 'slime' 'space' 'denebian'

/* Don't allow the gun to be dropped. */
/* ver = verify, do = direct object */
verDoDrop( actor ) =
{
"You can't leave the gun here. ";
}
```

```
/* Allow the gun to be fired if you still have slime. */
verDoFire( actor ) =
{
if ( self.shotsleft < 1 )
{
"No more slime left.";
}
}
doFire( actor ) =
{
/* Decrement number of shots left. */
self.shotsleft := self.shotsleft - 1;
/* If I'm not in the engine room */
if ( Me.location <> engineroom )
{
"You get slime all over yourself.";
}
else
{
"The slime clogs up the engine and the spaceship explodes.";
die();
}
}
;
```

Dani Roloson

>From the TADS manual (please read carefully):

(Like all TADS limits, this can be changed at compile-time with user-specified compiler options; of course, string space is also limited by the amount of computer in your memory, which you unfortunately cannot change with compiler options.

They are working on device independent graphics right, the problem
is, keeping rhe Amiga the leading desktop video computer without
damaging it's performance. (DIG is always slower than hitting the hardware
directly) We also have problems to worry about like programmable scan
rates, beam synchronization, sprites,multiple play fields, genlocking ,etc
Do many ST apps use VDI? I heard they hit the system a little more
directly. If they don't, I'm surprised the ST doesn't have lots of
graphic cards (and sooner). The main reason the Amiga didn't get them until
recently was lack of a graphics standard for external cards.

Not really that slower. 10% of .7? MIPS isn't much. The Amiga
isn't slowed down by the video hardware except by the megacolor
screens (half brite, ham, or the hires 16 color screens) and this only
happened if the user has no extra ram (fast ram).

>> Intuition is the GUI, workbench is the file/finder system (e.g. like

>
>Does it format standard MFM format so that every PC can read it?

The Amiga's filesystem isn't at like the ST/IBM PC format. But
filesystems are only the higher level organization of data. The Amiga
(and it's new HD drive) can write MFM tracks out exactly like
720k/1.44mb IBM disks, or 880k/1.72mb Amiga disks. For instance, on
my Amiga, I merely mount an MS-DOS filesystem and I can read/write
IBM disks from any application as if ithere was nothing different.

>>(A2024) 1024x1024 PAL on the Amiga without a graphic card, just need a nice
>>monitor. (The 1024x1024 also has 4 grey colors for the 3d GUI look)
>
>From what I've heard, the 2024 is a monitor with special hardware
>integrated in it that buffers screen frames and displays them at
>quadruple the speed the Amiga sends it. This way, the Amiga sends
>a forth of the whole screen in every screen frame, and the monitor
>composes the complete picture. This means you have a real refresh rate
>of 50Hz/4 or 60Hz/4. Not exactly what I would call "without a
>graphic card".

Well, you don't need any internal hardware to use it. You just buy
a $499 monitor. The refresh rate is 15hz, yes, but it's not bad.
The monitor is meant for publishing/cad/text applications, not
animation. The Amiga can send out one 768x240x4 screen every 60th of a
second (or 768x480x4 interlaced at 30hz) This is 92,160 bytes of data.
A 1024x1024x2 (or 1008x800x2) is about ~200,000 bytes. So it takes
~3.2 frames to transfer a screen to the A2024. I guess C= rounds it up to
4 so the A2024 updates at 15hz.

>>With Commodore's A2410 you get up to 1024x1024 with 256 colors out of
>>16.7 million.
>
>Is it available?

I hear its finished, but won't be released until AmigaUNIX v2.0
with X11R4 is finished. That way, the 3000UX can run a nice megapixel
/mega color Xwindows. (the A2410 has a 34010 processor onboard)

803. What's the best database for the ST ?

Newsgroup: comp.sys.atari.st
Date: 1991-06-27 21:12:57 UTC
From: redmond+@cs.cmu.edu
Message-ID: <1991Jun27.211257.1678@cs.cmu.edu>
Source record: 230837

I'm looking for a powerful, but easy to use database program for the ST.

I'm currently considering Superbase Professional 3.0
and dBMan v5.2

Could anyone send me their oppinions on these databases, and
recommendations (for the above, or others) ?

Thanks in advance,

Red/.

804. Atari Mega ST system for sale.

Newsgroup: comp.sys.atari.st
Date: 1991-06-27 22:59:29 UTC
From: gathings@cs.utk.edu

Cross-posted to: misc.forsale.computers,misc.forsale,comp.sys.atari.st

I am posting this for a friend.

FOR SALE
****

Atari Mega ST system with the following features:

- 2 megs of ram

- color Monitor

- 720 disk drive.

software

Asking $800 O.B.O.

please reply to me if you have any questions

Golando

805. Re: What's a STE anyway?

Newsgroup: comp.sys.atari.st
Date: 1991-06-28 00:27:35 UTC
From: freds@hpspdla.spd.HP.COM
Message-ID: <12020007@hpspdla.spd.HP.COM>
Source record: 230838

One of the bigger differences: All STes (mega and non) have
a color pallette size of 4096, instead of the old 512. And
And both the mega and non STe use simm sockets for RAM (thus
easy mem upgrades). Also, there are boards out that let you
go up to 10MB or 14MB for the STes
(I don't know which does which).

Source record: 230767

DRL>
DRL> I can get a 24-bit card for $299 (list). It takes advantage of the
DRL> Amiga's
DRL> built-in coprocessors. For about $100 more I can get one that also
DRL> includes
DRL> a slow-scan video digitizer. This one (DCTV) has been demoed at shows
DRL> paging
DRL> full-motion, full-color video off a HD and displaying it through this
DRL> advice in
DRL> real time (Watched a few minutes of Back to the Future III...)
NOT on a 500 though.. Not as easily as a 2000 I am sure....
I am comparing the 500 to the STe.. Compare the Mega Ste to the Amiga 2000 and it gets a little closer and the TT and the Ami 3000 might as well be the same machine... (Different capabilities here... I wouldnt really deam one or the other of killing the other.)
In SOME areas (Video is a biggy) the atari is behind yet...
However there are some boards available to boost the video. I have heard of some nice stuff comming out of Germany that makes the ST ATLEAST as functional in ANY bussiness arena as ANY computer out there... (Within $10,000 of the ataris price range.) HD Floppies, Tremendous graphics... Multi tasking environments. (UNless your running a bbs or drawing alot of fractals multi tasking has no real purpose.. I still stand by that statement...
The ONLY time I EVERY use multi tasking is when the task at hand takes a long time and I need the computer.. This only includes telecomputing... I use macs in a multi tasking environment.. I use unix machines... (Some neat stuff can be done with this in the background but thats different..) And of course my BBS on this desqview machine. (I do use desqview but only cause most dos programs are pretty brain dead...)

There are real time video digitizers available for the ST also..
The Ste brings GENLOCK to the ST easier then it does with an amiga...
(Plug it in like a monitor.)
Note, there are enhancements available that take the computer to extremes too... For roughly 1200 I could turn any ST into a machine that would be as fast as a TT, Ami 3000 or Mac fx.. With 32 bit of memory... (I think 1200 is actually something like with 2 meg of ram...)
Yes, Tos 2.x will work with ANY machine and is not a TT tos...
(However older machines do not have the ROM space for it so it might be a little tricky...)
Tos 1.6 in the Ste's is supposed to work with the 680x0 processors but I understand there are some quirks...
Tos 2.x is much better anyhow...
Other then the STe's Atari products have normally been VERY reliable...
The older St's did have a DOA problem but that was due to loose chips and not

fault of the hardware. I can't believe some of the stuff I did to motherboards while doing upgrades of memory to them and the ST's still worked... I know of quite a few local dealers that have had ALOT of problems in the past getting working amiga equipment... (Course you ask them now and they will deny it since most the employees have moved on to something else since then..)
(PS, who cares how long the warrenty is.. If you have to wait for parts for long periods of time what good is the warrenty. Sure you get the problem fixed but it takes forever sometimes...)
On broken in warrenty parts you can do UPS's equivelent of fed/exing it and get it back within a week from atari on their better days..
2 weeks otherwise..
The blitter is a little slower in the STe then the amiga.. But the STe's interface and usage of the Blitter is MANY times better then the older st's. Not to mention the amigas blitter was more "built into the system" then the st's ever has been. The Mega Ste comes swithcable at 8/16 mhz.. At 16mhz it blows a standard amiga out of the water..

810. Re: Amiga is better then what???

Newsgroup: comp.sys.atari.st
Date: 1991-06-28 04:45:38 UTC
From: Rod.Fulk@f24.n228.z1.FidoNet.Org
Message-ID: <678091803.1@therip.FidoNet>
Source record: 230768

Gem tasks can communicate between them.
As I said before TRUE multi tasking is of limited use. Specialty programs are available to do most things in the back ground. There is an explosion of PD programs that can multi task quite well. As well as communicate and such.
I realize these are not standards at this time but its only a matter of time.
DRL> Workbench is just as easy to use as any most other GUIs. Double
DRL> click
DRL> the icon & away you go...
Yes but its not as "intuitive" as the St or Macs Desktop.. If you compare the amiga desktop to Windows maybe it works well and is very powerful... ;-)
(CLI support is heavy in the ST.. They just didnt provide the actual interface to one. There are alot of powerful Cli's out there. I like to run a unix clone type CLI when I DO need a CLI.. But the GUI is powerful enough you do not need the CLI...)
DRL> As far as "pure power", I've yet to see a GUI with the pure power of
DRL> a Unix-like command line, which is part of the Amiga OS (note that you
DRL> don't _have_ to use this; it's just there in case you want to).
The STe and above have VERY powerful features tucked away in their desktops... Unless your a programmer you will never see them anyhow... (Isnt this the way its supposed to be? ;-))
DRL> Nearly every Amiga user I talk to uses it on a regular basis. I'm
DRL> doing
DRL> it now. A BBS is certainly far from the only time multitasking is
DRL> useful.
DRL> A list of the processes currently running on my system (using Snap, one
DRL> of those processes, to clip this text from a window & paste it here):
(list of processes deleted.) Yes but those programs you listed could be run as TSR's too.. The ST DOES support specialized multi tasking... YOu just can not do full blown multi tasking. The ability to run them in a full blown environment makes it kinda nice but its not a necessity... (I have a few processes running on my ST in the background too.. But they are either desk accessories like my terminal program or they are TSR's such as my ram disks and caches... And some performance enhancers are available too as well as things to make my screen bigger and such...)
DRL> How is this superior to the Amiga's 4 channel 8 bit stereo sound? (8
DRL> bit
DRL> on all 4 channels, not just 2 of them). There's even software
DRL> (Octaplayer?)
DRL> that supposedly pushes out 8 voices. Of course, unlike the ST, the
DRL> Amiga's
DRL> sound is driven by yet another coprocessor, so it takes almost 0 CPU
DRL> time to
DRL> play a musical score or a digitized sound (as a background process in
DRL> your

Ahh but your wrong.. IN a standard ST even the chip is a coprocessor. NO cpu time is taken to do most non-digital sounds. It is a synthisizer chip and you load it and it goes.. In the New STE you have 5 seperate voices... These can be seperated into 3 different speakers. Unlike the Amigas dual purpose channels (Which can do either digital or synthisized sound) Each of the STe's channels are specialized. Depending on your usage of the STe you can get alot of sound out of it... (It wouldnot be difficult to get 4 and possibly 6 channels on an STe in the digital channels the same way as the amiga does.. These could be played off the stereo channels while the monitor or another speaker plays a totally synthisized accompliment. CPU overhead? Just load up the memory and plug the proper pointers with the addresses... (Its called DMA sound... ;-) Same as the amigas..)
As to the Disk drives... The ST uses a coprocessor too that doesnt take up much of the CPU time. It also is a DMA device.... (Same as the amiga... Same problem getting the HD drives to work too. Although the ST world has more then conquored this problem...)

From: Rod.Fulk@f24.n228.z1.FidoNet.Org
Message-ID: <678091803.2@therip.FidoNet>
Source record: 230769

DRL>
DRL> >Since the ST uses standard parts it is easy to get most of the items...
DRL>
DRL> Eh? Standard parts? Like the standard SCSI drive inside my Amiga, the
DRL> standard memory chips, the standard printer connected to my standard
DRL> parrallel
DRL> port right next to the standard serial port which talks to my standard
DRL> modem?
I said standard parts... Such as the RF modulator.. (RS part) the drive controler (RS part) the sound chip (RS part) very ver properitory (sp?) chips in the ST.
DRL> I can use all the memory in my system too. I just have to keep
DRL> graphics &
DRL> sound data in the 1st 2 megs. Why do you say the Amiga has to waste
DRL> memory to
DRL> do d.b. graphics & sound? Having to keep it in a limited section of
DRL> memory
DRL> only constitutes a limitation, not a waste.
2 meg? You must have a 3000 cause the others are limited to 1meg and the old 500's to 512k. Any time you must load the data into the upper memory and copy it down into lower memory to be used is wasting memory.. (Ie having it in two places at the same time..) Not to mention the slowdown while copying the memory around.. (ST's have a four meg limit.. That should make a BIG difference when the bigger graphics displays become common.)
DRL> On the subject of memory, what exactly is the difference between "ST
DRL> memory" and "TT memory" on the TT? Is ST mem 16 bits wide?
No, the ST memory is limited to 4 meg... (Same as chip memory as opposed to fast memory.. The TT uses the same type of setup memory wise as the Amiga.. CPU ram is VERY fast and is unlimited in theory.)
DRL> Oh? On what do you base this assumption? I really don't know what
DRL> business software is available for the ST other than PageStream (is
DRL> 2.1 out yet for the ST? I've been using it for a while, & am looking
With the St you have a rock solid display that except for the Ami 3000 you can not get at all... You can get close to the mono screen but you cant quite get there... (The TT's high mode is 1280x960... The TT's lowest TT mode is 256 colors out of 4096 in a 320x480 screen and the mid screen is 640x480 with 16 colors These match very well with the Amigas graphics... Not "quite" as good but close enough your not likely to tell real easily.)
Since the St uses a double speed buss split between the DMA chips and the CPU I believe the support chips can access the memory when the CPU doesnt.. When IT accesses the memory i believe it might be in 16 bit mode....
When the CPU has its share it will access the ST memory with a true 32bit access. I could be wrong there but that was my impression. (Ie in a normal ST the buss is a 16mhz buss and everything runs on alternate buss cycles so the

CPU doesnt load the coprocessors down AT ALL...)
The stuff Atari is comming out with now is very good. Unfortunetly at present they are about a year and ahalf behind. (ALthough they are catching up quickly hardware wise..) It shouldnt be too long before Atari is in the front runners again... Although I don't know if it will at that time be solely a "german" computer.... BTW, if your GUI was so great why use a CLI? The Newer STe's and newer have powerful enough GUI's that CLI's are not necissary for anything except specialized jobs...
(Software wise the ST has a slighlty better selection of bussiness programs.. Such as data bases, spreedsheets and that stuff...)

813. Advice on 3D drawing programs sought

Newsgroup: comp.sys.atari.st
Date: 1991-06-28 08:31:06 UTC
From: reeuwijk@dutentb.et.tudelft.nl
Message-ID: <1991Jun28.083106.14071@donau.et.tudelft.nl>
Source record: 230844

I am looking for a program to draw 3-dimensional figures,
and that is able to show them from arbitrary points of view.

Desirable features are (in order of importance):
- STe (TT?) & monochrome monitor compatible
- Hobby budget (more than #150=$300=dfl600 will lead to much
head-scratching)
- Easy input of figures
- Bug-free
- Interfacing to Arabesque or other 2D drawing program
- Fast
- Splines. Considering the rareness of 2D drawing programs with this
I know this is idle hope. Arabesque calls its latest version
'professional' just because it has splines!

I prefer a program that allows input as 2D figures that are somehow
extended to 3D (extrusion, spin, or ideally deduction from two views
of the object) instead of programs that only allow the combination
of standard 3D figures, but I may have to compromise on this.

The programs that I am aware of are:
- 3D-cad/cyber-studio. I am a bit confused by the enormous amount
of separate programs/packages in this line of products.
- Master cad. Looks nice in the folder and the slide-show demo,
and worth a gamble considering the price.
- 3D construction kit. I only saw this in a price-list of a mail-order
company. I have no idea what it does.

Any recommendations or dis-recommendations :-) are welcome.
Thank you in advance for any reply.

Just a slight correction and addendum to the following.

In article <3564@laura.UUCP> klute@tommy.informatik.uni-dortmund.de (Rainer Klute) writes:
|
| LHARC:
| Slow and unreliable. It has become popular because it has the best
| compression factor. However, archiving and extracting is really slow. There
| are several not always compatible LHarc versions by different authors
| floating around. So if you don't have the right LHarc you might not be able
| to extract an archive at all. Just say NO.

LHARC is *extremely* slow to make an archive, but it is usually
considered as a fast extractor, in addition to its compression factor.

I would just like to point out that sometimes ZOO creates a better
compressed archive than does LHARC.

There are drivers for Epson and Desk/Laserjet printers. The `prn_xxxx' files
are produced by GS for dumping to the relevant printer.

817. GFA Basic timeout INP possible ?

Newsgroup: comp.sys.atari.st
Date: 1991-06-28 10:02:37 UTC
From: mpj@sequoia.cray.com
Message-ID: <035236.9564@timbuk.cray.com>
Source record: 230753

Hi there,

Some BASICs include a timeout option for the INP(#n) function
which polls for a byte on an input port.
For example, the Sinclair QL had A=INP(#1,5) which meant "if you
get no input from the port #1 within 5 seconds, return zero and
continue". Some BASICs use SNS(#n) which returns immediately
(with 0 if no input was present) so that the program can continue.

Does anyone know if GFA Basic will allow this ? Apparently not;
so far my programs hang on the INP if there is no more input.
I'd like to unblock the situation without manual intervention!
I am hoping there is some darker way of checking for data in the
input buffer for the port.

Thanks,

Marvin.

818. Converting Deags Elite pictures to the 1st Word Plus picture format

I already sent you the sources for an lh5 extractor/creator via email (on
wednesday). Did you recieve them already? The program works perfect and
very fast (altough it's pure C)...
So the problem with the LHA 2.xx archives using the lh5 compression method
should be over...

> the amiga OS's.. (The 2.0 doesnt really count at this point since last time
> I looked it was not available on amiga 500's yet)

No, it's not available for the A500 yet. Feature-wise, I believe AmigaOS 2.0
was done some time ago, and Commodore programmers have spent the last several
months trying to make it compatible with older software. Unfortunately some
people who developed software for the Amiga brought along various bad habits
which they picked up while developing for more primitive, non-multitasking
systems, thus leading to buggy software.

> Of course the amiga does multitask but I have very little use for multitasking..

That's what many people say, until they try Amiga multitasking.

> As to sound? Well The ST is the only one so far that has the capability of 3d
> sound. The STe series computers have the capability of using 3 seperate
> speakers with different sounds out of each.... 2 of those full 8 bit digital..

How many bits is the other channel?

> ALL the memory can be used in an ST as compared to the amigas limitation
> of chip memory...

So you're saying the ST can use all 16 Megs for graphics? I admit I wasn't
aware of that. I thought it used a screen buffer.

> (Note the ST does not waste memory... You must waste memory on an amiga to
> do double buffered graphics and digital sound at the same time.)

Please explain what you mean by "wasting" memory.

821. Re: MiNT, MGR, emacs, problems and questions

Newsgroup: comp.sys.atari.st

In article <1991Jun26.113111@geog.ubc.ca> peter@geog.ubc.ca (Peter Jackson) writes:
Hello, I am setting up a system with MiNT and MGR and have encountered
some problems and questions that I hope someone could help with:

1. MGR works fine with the init.prg supplied with MiNT, but if I try
to use BASH or gulam as my shell, then I get a "can't get a pty" error
when I try to open a windom. (I remember someone mentioning a solution
to this before, but didn't take note at the time)

I've seen this also. I assumed it was because I only have a measly 1Mb
or memory and that there wasn't enough to start another shell.

2. BASH seems to choke when using the LS.PRG supplied in akputil7.zoo
- I get a bus or addressing error and MiNT crashes. LS.PRG seems to work
fine with other shells. Has anyone else encountered this? Is there another
LS that I should be using?

Another ls you could use is in the unix directory on atari.archive,
its about the same as the akputil one. Unfortunately neither of them
seem to support multicase filenames as are possible under MinixFS (I
may get around to looking at this someday).

3. What (emacs-ish) editor are people using with MiNT/MGR? I have tried
mg2a inside a mgr vt52 widow - the text came up fine, but every keystroke
generated garbage (an @ character I think). I had problems with me310 as
well.

Mg2a seems to have problems outside of MGR too. In text mode when you
exit it the control key is locked in down mode (wierd huh!). I suggest
using gulam as the shell as it has an editor built in until a proper
emacs is available.

4. Has anyone compiled gnu-emacs to operate under MiNT and allow multiple
shells etc? (This is my preferred windowing environment) If so, would
they care to share the changes that were necessary to compile the
sources?

This was in another thread (which I didn't read, sorry).

Every GEM application uses the VDI. There are lots of programs, though,
that won't work with any resolution VDI will offer them, that's a sad
truth. But the standard is there, and it works fine. In Germany, we
have quite a few graphics cards for the ST, including a 24-bit graphic
card. In the US, the situation may be entirely different.

>>Who uses lo-res? Gamesters - but not me.

> Don't you need 2 monitors for the ST? One lo-res color and one mono?

In general, I use the mono modes only. Using a multisync, you don't
need two monitors. It's just that the SM124 has such a brilliant display -
much better than standard multisyncs, and that's why people are using it.
Anyway, I'm a bit old-fashioned. I need exactly two colors on my computer:
Black and white.

>>Does it format standard MFM format so that every PC can read it?

I know quite a bit about the Amiga's filesystem, but I didn't know
the new HD drives can write a genuine PC MFM format. Tnx for the
information. This must have been done by using intelligent drives,
I suppose.

> Well, you don't need any internal hardware to use it. You just buy

827. getting TeX up and running on your ST

Newsgroup: comp.sys.atari.st
Date: 1991-06-28 15:58:06 UTC
From: davidli@simvax.labmed.umn.edu
Message-ID: <1991Jun28.155806.1@simvax.labmed.umn.edu>
Source record: 230760
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Basic Installation of a working TeX/LaTeX on an Atari ST.

The following is a description of what I did in order to install TeX and LaTeX on my Mega4 ST with a 20 megabyte hard drive and an Epson LX-86 printer, using files available on the atari.archive.umich.edu server. The basic system described occupies a bit over 4 megabytes on my 'd:\' partition, and I still need more fonts ...

WARNING
=======

If you don't have more than 1 megabyte of memory, you'll need one of the special shells available in /atari/tex/shells. Otherwise, GULAM or MUPFEL or OKAMI might work just swell. And don't even think about running undump.ttp on anything less than a 2.5 meg machine. The following is informational ... don't blame me if you become a TeX addict.

Some setup stuff
================

Directory structure:

\tex
\tex\fonts
\tex\formats
\tex\inputs

Environmental variables:

TEXFONTS \tex\fonts
TEXFORMATS \tex\formats
TEXINPUTS \tex\inputs
TEXPOOL \tex

Files used in installation (all are available from atari.archive.umich.edu):

TEXBIN.LZH INPUTS.LZH TFMFONTS.LZH BIBTEX.LZH
FORMAT31.LZH MANPAGES.LZH DVIFNTS1.ZOO DVIFNTS2.ZOO
DVIFNTS.HLP DVIATARI.ZOO DVIEPS.ZOO

"How I did it"
==============

1. Unarchive MANPAGES.LZH and place the files where you usually keep man pages. (I put them in \usr\man\man1)

2. Unarchive the fonts files DVIFNTS1.ZOO and DVIFNTS2.ZOO.

```
cd \
zoo -restore dvifnts1
zoo -restore dvifnts2
```

Notes: The commands above restore the fonts in a root directory '\fonts'. Use whatever methods you have (I used UIS 3) to move the directories under '\fonts' to \tex\fonts.

3. Unarchive TEXBIN.LZH and place the files in \tex.

4. Unarchive BIBTEX.LZH and place the files in \tex.

5. Unarchive INPUTS.LZH and place the files in \tex\inputs.

Notes: There are some longer-than-8-character file names in the archive. Fortunately, they're all first-8-character-unique.

6. Unarchive FORMAT31.LZH and place the files in \tex\formats.

7. Unarchive TFMFONTS.LZH and place the files in \tex\fonts.

Notes: There are some longer-than-8-character file names in the archive. Unfortunately, several of these are NOT first-8-character-unique. I did nothing beyond answering 'no' to LHarc queries about overwriting files. The long file names appear to be present in a shorter form as well -- and they're all PostScript font names anyway...

8. Unarchive DVIATARI.ZOO and place the files in \tex.

9. Unarchive DVIEPS.ZOO. You only need the following files from the archive:

DVIE72.TTP DVIEPS.TTP EPS.TTP SETUPTEX.G

Notes: Some 'nice to have' files include: README.TEX and DVIST.DVI. Most of the files in this archive are source code, and you don't really need them to make the TeX and LaTeX work.

10. Set the environmental variables. There is a gulam script called SETUPTEX.G works quite nicely once you've edited it to reflect proper disk partitions (ignore the aliases though).

11. Test the setup using README.TEX from the DVIEPS.ZOO archive:

```
cd \tex
virtex \&lplain readme.tex
dviatari readme
dvieps -z readme
```

Notes: The gulam CLI requires the '\' before the '&' -- the CLI I use works nicely with 'virtex &lplain'. HOWEVER, LaTeX was unable to find the file 'readme.tex', and I had to enter the filename at the prompt as '.\readme.tex'. If anyone has any idea why this might be, please let me know. It -might- be because of ARGV vs. xARG problems...

dviatari.ttp worked nicely on my color monitor, although it had to substitute some 300dpi fonts because I was missing 240dvi fonts, so

some things look a little funny.

dvieps.ttp worked nicely for my Epson LX-86 9-pin printer. It takes
a looooooong time to print, though the output is truly 'TeX' standard.
Without the '-z', a file will be created -- but beware! The file takes
about 350K disk space per page!!

OK, so what next?
==========

There are other device drivers, including PostScript and HP Deskjet drivers
available. I don't have anything to test these with (yet... I just got the
GhostScript drivers.)

There is a definite need for more 1200 magnification (240dpi) fonts, since
both dviatari.ttp and dvieps.ttp use this magnification of fonts. So, it
looks like I'll have to get hold of MetaFont and spend some time creating
more fonts.

I tried using the 'undump' program, also available on atari.archive.umn.edu.
It produced an 850K LaTeX executable. I decided that virtex.ttp and the
lplain.fmt file were fine, since they didn't take up 850K together. and
to produce executables for TeX, LaTeX and SliTeX would take up nearly 2.5
megabytes of space on my 20 meg hard disk.

I also ran a LaTeX file called 'layout.tex' through, and it produced very
nice output, although the fonts were off because they were 300dpi rather
than 240dpi.

There are, of course, more files in the /atari/tex/tex31 directory, but they're
not necessary for a basic working system (ie. nice to have, so if you have
the disk space, unarchive them in your \tex directory). By the way, just what
is VF_FONTS.LZH useful for anyway???

Oh yes ... don't bother with the other font archives in the directory
/atari/tex/fonts on the atari.archive.umich.edu server. They don't contain
any =different= fonts from those in the two Zoo archives mentioned above.

Fonts. Did I mention fonts?

That's all folks
==========

I hope this helps someone out there who's been dying to try TeX and LaTeX
but couldn't figure out what was needed to set up a workable system.

Please feel free to write to me with your experiences, advice on getting
more 240dpi fonts, alternative methods of putting things together, etc.

Check if there's anything waiting for you with INP?(#channel).
It'll return a TRUE if there is, a FALSE if there ain't. If you
want to time input, say with a FOR loop:

```
FUNCTION get_input
FOR i%=1 TO 1000
IF INP?(#1)=TRUE THEN
RETURN INP(#1)
ENDIF
NEXT i%
RETURN 0 ! Or whatever
ENDFUNC
```

(I assume you're using GFA 3.x, too. I don't know about 2.x...)

Greetings World..

A friend of mine wants to sell me his Canon
model BJ-10E Bubble jet printer. I borrowed it but
could not find the right printer driver to use it
correctly. I could see from what printed out it was
of a much higher quality than my Panasonic (pin type)
printer. Does anyone have a printer driver program
they could donate? I also would appreciate any informed
opinions about this type of printer i.e. whats a good
price, quality, complaints, and/or a way I can get the
right printer driver.
Thanks,
Doug White

>I know quite a bit about the Amiga's filesystem, but I didn't know
>the new HD drives can write a genuine PC MFM format. Tnx for the
>information. This must have been done by using intelligent drives,
>I suppose.

The Filesystem has alittle to do with the density of the drive. All
the file system cares about are block numbers. What controls the drive
is the trackdisk.device. For instance,a normal 880k disk has
1738 sectors and the Filesystem might ask the trackdisk.device to
read block 1600 (which may be a part of a file, a directory sector, whatever)
The new drives in the 3000 are variable speed drives like the Mac, so
the drive motor can be slowed to 1/2 speed giving twice the density without
a more expensive drive head or a new controller chip. So all the new
system does is check if your using an HD disk and switch drive speeds.
Writing PC format is no problem in the HD mode.

>> Well, you don't need any internal hardware to use it. You just buy

>>second (or 768x480x4 interlaced at 30hz) This is 92,160 bytes of data.
>>A 1024x1024x2 (or 1008x800x2) is about ~200,000 bytes. So it takes
>>~3.2 frames to transfer a screen to the A2024. I guess C= rounds it up to
>>4 so the A2024 updates at 15hz.
>
>And how many cycles does this cost for the CPU?

Zero CPU cycles. The display doesn't eat CPU cycles as long as you
have fast ram. A more appropriate question would be to ask, how
many blitter cycles does it cost? Answer: it will eat 50% of blitter
cycles. The A2024 monitor also has a 10hz mode that only ats 25%.
I suspect putting the A2024 in mono mode will eat zero.

>> I hear its finished, but won't be released until AmigaUNIX v2.0

>
>And a fast gfx processor will be needed judging from my experience
>with X 8-(

That's what the TI34010/34881 is for. The Xwindows code will probably
run on the 34010 processor itself instead of the 68030.

Using a counted loop as a timer is not a good idea in this day of multiple
processors and speeds. Better to check the value of a system clock, so that
the program will not behave in a strange fashion when executed on a Mega
STE or TT030.

835. Help -- locked out of hard disk

Newsgroup: comp.sys.atari.st
Date: 1991-06-28 21:49:57 UTC
From: peter@geog.ubc.ca
Message-ID: <1991Jun28.144957@geog.ubc.ca>
Source record: 230761

Help! I made some changes to the programs I load at start-up, the result of which is a machine that just hangs. No problem, right? I can turn off my hard disk, boot from floppy, start up the hd and then run icdboot.prg. (this has always worked before) However when I try this icdboot.prg gives a tos error #35 whenever it is run after the hd is turned on. (I can run icdboot.prg with the hd turned off - no tos error #35, however the hd of course isn't installed)

Does anyone know why turning on the hd will result in tos error #35 with icdboot.prg? Anyone have any suggestions?
Thanks.

In a message of <24 Jun 91 04:20:23>, dddean@bluemoon.uucp (2:320/100.1) writes:

d> over here. Also: Would there be any type of compatibility problems?
d> I have heard that the programs over there will not run on our US
d> machines.

That depends. Lots of games use the VBL interrupt for their routines. The VBL interrupt is generated 50 (vertical blank rate of 50 Hz) or 60 (vertical blank rate of 60 Hz) times a second in color mode. (72 Hz in monochrome) And here is where the problem lies. The non-US machines use the NTSC standard of 60Hz, where the machines in Europe use the PAL standard of 50Hz. On a machine with a VBL rate of 50Hz, one can 'use' more CPU clock cycles per VBL than on 60Hz, because one VBL takes longer. Now if the routines executed in one VBL take up say 99% of all available CPU time, these routines cannot run in 60Hz, because there will not be enough CPU time. When this is the case, the game will crash. But if the routines take less time, so that there is enough CPU time in 60Hz, the game will run. The only effect will be that everything goes more quickly than in 50Hz.

838. This week's program

Newsgroup: comp.sys.atari.st
Date: 1991-06-29 00:22:15 UTC
From: uace0@menudo.uh.edu
Message-ID: <1991Jun29.002215.20761@menudo.uh.edu>
Source record: 230766

Here is a synopsis of this week's Program of the Week. We've sent it to atari.archive.umich.edu (ftp-able) and also to comp.binaries.atari.st (who knows...).

DC GTP (GEM Takes Parameters) allows you to enter a commandline (or use the file selector to choose a file parameter) for a GEM program. This is similar to the NewDesk (MSTE and TT) new program type .GTP extension.

100% assembly. ST, STe and TT compatible. Program of the week.

This program was mentioned during a discussion in st.tech, and we listened very closely! Here ya go! (NEXT!)

>be done with this in the background but thats different..) And of course my
>BBS on this desqview machine. (I do use desqview but only cause most dos
>programs are pretty brain dead...)

I disagree wholeheartily. Multitasking is very useful. If it wasn't, why is multifinder integrated into the Mac's OS now? Why OS/2, why GEOS, why Window's? Because multitasking is important. I can't stand other computers the way you get locked into an App sometimes. When I'm downloading, I like to be doing something else, like working on a program, or editing something.

>There are real time video digitizers available for the ST also..
>The Ste brings GENLOCK to the ST easier then it does with an amiga...
>(Plug it in like a monitor.)
Plug what in? You can get very cheap genlocks for $60, but the more expensive $1000 ones on the Amiga have multichannel/multisource genlocking, selective fade/blend, genlocked audio, custom wipes, etc. A genlock that can't fade/wipe is not very useful. Besides genlocking, the Amiga can CHROMAKEY which means putting live video infront rather than behind the computer's graphics. It can also use any color register for the transparent color, not just the background color{

>Note, there are enhancements available that take the computer to extremes
>too... For roughly 1200 I could turn any ST into a machine that wqould be as
>fast as a TT, Ami 3000 or Mac fx.. With 32 bit of memory... (I think 1200 is
>actually something like with 2 meg of ram...)

Likewise, the MegaMidget racer cfor $599 gives you a 33mhz 68030 w/32bit memory for your A500.

>working amiga equipment... (Course you ask them now and they will deny it
>since most the employees have moved on to something else since then..)
>(PS, who cares how long the warrenty is.. If you have to wait for parts for

>long periods of time what good is the warrenty. Sure you get the problem fixed
>but it takes forever sometimes...)

This is unsupported bull. I know over 50 people with Amigas and
none of them have problems. I have had my Amiga for 4+ years and it has
never given me trouble. The only known problems with Amiga's were the
rev 4.2 A2000 motherboards and the loosely seated chips in the bridgcards.

>On broken in warrenty parts you can do UPS's equivelent of fed/exing it and
>get it back within a week from atari on their better days..
>2 weeks otherwise..

You pay no shipping cost for C='s FedEx and it gets fixed in <2 days.
(They will swap the entire motherboard if they want). If you have >A2000
machine you get onsite repair. (SOmeone comes to your house and fixes it
right then and there)

>Not to mention the amigas blitter was more "built into the system" then the
>st's ever has been. The Mega Ste comes swithcable at 8/16 mhz.. At 16mhz it
>blows a standard amiga out of the water..

16mhz 68000 doesn't really blow a 7mhz 68000 out of the water in performance,
I'd say less then 2x performance (probably 1.5). Strickly because
with a faster clock rate you need a better ram system. I could put a
33mhz 68030 in my Amiga, but if I didn't have any 80ns 32-bit ram the
68030 would run at 1mips.

The extra speed comes from 32-bit access, and and faster ram to cut
down on wait states.

Right now I am on a BSD Unix machine. If I get a write message from a user or if I get a mail notice, I can stop rn/emacs, and go respond. Likewise, I can start up a huge compilation (average time, 5 minutes) and read news while it's compiling. The ability to have multiple shells and run multiple programs is invaluable to me.

>the CLI...)

What not's intuitive about Workbench? Give an example please? I find most of the Finder/Gem type stuff is nothing but a glorified program launcher/file renamer/copier. If GUIs are so powerful then why do Mac developers use MPW? The bandwidth of the mouse/icon interface gets in the way sometimes. I can type cc -c *.c faster than I can drag 20 source icons onto a compiler icon.

> DRL> As far as "pure power", I've yet to see a GUI with the pure power of

>accessories like my terminal program or they are TSR's such as my ram disks
>and caches... And some performance enhancers are available too as well as
>things to make my screen bigger and such...)

This is not multitasking (not really). These programs on the IBM
(TSR)'s are more like interupt handlers. They don't multitask. Each one
of them runs until completion. Let's suppose you have a screen blanker that
draws fireworks on the screen and a hotkey utility. While the
screen blanker is rendering, the hotkey utility will get no cpu time.
The more the screen blanker takes, the less the hotkey gets. it also
makes things load order dependent.
On the Amiga, the screen blanker will get interupted while it's rendering
to give the hotkey utility some CPU time. In addition, AmigaDOS 2.0
has made load-order dependency totally vanish. Commodities Exchange
allows multiple "enhancer" (INIT/DA time programs) to peacfully coexist
even if they watch the same keys on the keyboard. No more load-order
dependency.

[followups to advocacy, since I may be getting on some ST users' nerves]

"That's the problem with standards, there are so many to choose from."
The Amiga chips have been in mass production for 6 years. They are
very cheap now (since they are in mass quantities).

> DRL> I can use all the memory in my system too. I just have to keep

>500's to 512k. Any time you must load the data into the upper memory and copy
>it down into lower memory to be used is wasting memory.. (Ie having it in two
>places at the same time..) Not to mention the slowdown while copying the
>memory around.. (ST's have a four meg limit.. That should make a BIG
>difference when the bigger graphics displays become common.)

The Amiga doesn't "copy" data. Let's say you have a compressed animation
loaded. 2 screens will be allocated in chip memory. The first frame
will be displayed and while it is being display, another frame will be
"decompressed" directly to the other frame. This is copying in a minor
sense. What about resident programs? Putting programs in a ram disk
is a waste of memory? Why? Because the program exists in 2 copies.
The one copy that is in the ram disk, and the one that gets loaded and
executed from the ram disk. On the Amiga, you make a program "resident"
(it has to be reentrant and re-executable) and you can run as many
copies as you like without taking any extra memory except for stack.
(For instance, I could run 100 copies of the program "ls" program
which is 16k long and only eat 116k of memory. 16k for the 100 programs

(all running the same code in ram, not copies) and 100k for the
100 1k stacks for each task. Without resident code, you would need 1.7
megabytes to do this. Not a very good example, but in 1mb of memory
I can run 3 or 4 copies of my favorite editor (100k executable) and only
use 100+k of memory.)

> DRL> On the subject of memory, what exactly is the difference between "ST
> DRL> memory" and "TT memory" on the TT? Is ST mem 16 bits wide?
>No, the ST memory is limited to 4 meg... (Same as chip memory as opposed to
>fast memory.. The TT uses the same type of setup memory wise as the Amiga..
>CPU ram is VERY fast and is unlimited in theory.)

Does this mean the normal ST is limited to 4mb? (barring hacks to
the motherboard) The Amiga's normal limit is 9mb (the 68000 is
limited to 16mb due to it only has 24 address lines) Of course
any 68020/30 board would give you more, but I'm talking standard
add on memory. No processor upgrades.

> DRL> Oh? On what do you base this assumption? I really don't know what
> DRL> business software is available for the ST other than PageStream (is
> DRL> 2.1 out yet for the ST? I've been using it for a while, & am looking
>With the St you have a rock solid display that except for the Ami 3000 you can
>not get at all... You can get close to the mono screen but you cant quite get

Deinterlacer's on the Amiga cost ~$200 now. Every Amiga can have a rock
solid display. With the ECS Denise chip you don't need a deinterlacer.
With the A2024 you get 1024x1024x4. (not mono) You need atleast 4
colors to have a nice "3d-look" GUI. (background, highlight, shadow, and
text color)

>computer.... BTW, if your GUI was so great why use a CLI? The Newer STe's and
>newer have powerful enough GUI's that CLI's are not necissary for anything
>except specialized jobs...

That's because the Shell is great for lots of things especially
scripting and batching. Let's say you wanted to catalog every
c source on your harddisk to a file?

```
$ ls -R rootdir | grep \\.c\|\\.h >t:filecat
```

There are things you can do in a shell that are just not possible in
a low-bandwidth environment like a GUI. That's why even Mac programmers/power
users use MPW or some other shell.

>(Software wise the ST has a slighlty better selection of bussiness programs..
>Such as data bases, spreedsheets and that stuff...)

Examples please. The Amiga has a multitude of databases, spreadsheets,
authorware, etc. For instance, the Amiga has SuperBase Professional 4,
DBMan V(Dbase clone), MicroFiche Filer, Advantage, Analyze, MaxiPlan,
SuperPlan, VIP Professional, Accountant, Best Bussiness Management,
Datatax, Desktop Budget, Easy Ledgers, Phasar 4.0, Service Industry
Accounting, etc, etc. It's easy to make statements like "slightly

better" it's harder to back them up when it comes time to
compare quantity and quality.

[followups to c.s.a.advocacy, I'm out of this group.]

843. What's wrong with Atari? - Continuation

Newsgroup: comp.sys.atari.st
Date: 1991-06-29 14:06:44 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <9106291406.AA21475@cwns2.INS.CWRU.Edu>
Source record: 230774

Ok, I have heard from many of you about what is wrong with Atari, but there are many more of you that I wish to hear from.

I will send all the messages I receive to Atari Corp. and will try very hard to get it to someone in top management.

I need to know what is wrong with Atari and your solution. There are many people that are responding without a solution and this is just as important as the complaint.

Of course there are a lot of things RIGHT with Atari, but what I need here is what is wrong with it so they are aware of the problems and can attempt to fix them.

Please respond to me e-mail.

Len Stys

844. What is right with Atari?

Newsgroup: comp.sys.atari.st
Date: 1991-06-29 14:10:55 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <9106291410.AA21797@cwns2.INS.CWRU.Edu>
Source record: 230775

Ok, after reading over my last posting and remembering some lectures from
my psychology class, I know positive reinforcement should not be forgotten.

Please send me e-mail on what is right with Atari so they can continue
to do what you like seeing done.

I will make two booklets, one with what is wrong and one with what is right.

Thanks.

Len Stys

846. Re: Was: How is Atari doing in Europe?

Newsgroup: comp.sys.atari.st
Date: 1991-06-29 15:37:24 UTC
From: adamd@rhi.hi.is
Message-ID: <3318@krafla.rhi.hi.is>
Source record: 230777

csbrod@immd4.informatik.uni-erlangen.de (Claus Brod) writes:

[about reclamation of GEM space]
>Much more address range is "wasted" by the generous hardware register
>assignments.

32 kB was fine. 1 MB is certainly over-generous on a system with maximum
16 MB address space. The reason that it was 32 kB is presumably so that
all the hardware can be accessed using absolute short addressing modes.

>I don't know a single application that would run on a 1 MB ST without
>GEM and doesn't because GEM installs its own data areas.

True, but less data space is available to the program. When we get into
multitasking it might be necessary to choose between several non-GEM apps
or one GEM one. I do not say GEM is bad or takes too much space, only that
it is a pity not to be able to return that space when no longer needed.

>lots of other, more important things in TOS that should be improved
>before this.

Absolutely!

>Most of the memory GEM uses is malloc()'ed just like any other memory block.

So all that is necessary is to incorporate an exit mechanism in the GEM code.
Might this happen someday?

847. GCC 1.39 -g Problems

Newsgroup: comp.sys.atari.st
Date: 1991-06-29 18:49:00 UTC
From: Frank_Celler@k2.maus.de
Message-ID: <21313@k2.maus.de>
Source record: 230640

I have got "gcc139b.lzh" containing the GNU assembler for ATARI-ST
version 1.38 from Uni Koeln and the GNU debugger "gdb" from A.A.
When trying to compile a file with the "-gg" option, the assembler
reports an unkown option "G" and starts reading the (compiler) symbolfile
as input file. When trying to compile with "-g", I get a bogon-alert
from the linker. Does anyone know what's going wrong? How can I use
the debugger? Unfortunately I only have docs for GCC 1.37.

Thanx in advance
Frank Celler

848. Memory Upgrades

Newsgroup: comp.sys.atari.st
Date: 1991-06-29 22:29:24 UTC
From: yonder@netcom.COM
Message-ID: <1991Jun29.222924.14936@netcom.COM>
Source record: 230787

I'm planning on doing a memory upgrade on my ST. I would like to go
to 4Meg. It appears I have two options with my 1040STf:

1: buy one of the memory upgrade boards.
2: sell my STf and get and STe

In either case I would like to get SIMMs that would be compatible with
the RAM needed for IBMs, in the event of an IBM-compat. purchase in
the future. I believe IBM-compats. require 9 bit vs. 8 bit of
Atari/Mac.

Questions:

Q: What is the best memory upgrade -- easiest to install, MOST
RELIABLE!, compatible, flexible, cheap and available?

Q: Is there a memory upgrade hack like there is for the 520? I do
not fear soldering guns...

Q: Anybody want to comment on just getting an STe? How much would
this upgrade path cost?
cost = (ste price) - (sale of stf) + (pain in neck factor)

Q: Did I get the 9-bit (IBM) vs. 8-bit (Atari/Mac) deal correct? And
can I use the 9-bit SIMMs in available memory upgrades or the STe?

...thanks ahead of time for any info.....

849. HD interfaces ICD vs. BMS

Newsgroup: comp.sys.atari.st
Date: 1991-06-29 22:39:44 UTC
From: yonder@netcom.COM
Message-ID: <1991Jun29.223944.15359@netcom.COM>
Source record: 230788

I am planning a HD upgrade. I have a SH204. I'm thinking of selling it and getting a SyQuest 44M removable. Ultimately I would like to have a fixed drive and the SyQuest hooked up. Anyways, I would usually figure that the ICD interface was the way to go, but I have seen alot of messages about the BMS interface here on the net.

Would anybody like to comment on the relative merits of the two interfaces: price, availability, RELIABILITY, COMPATIBILITY, physical size, performance, support and personal experiences.

In the compatibility area I would like to know how flexible the drive is in the area of working with a large range of drives. Also how about GCR compatibility?

850. Cooling an ST

Newsgroup: comp.sys.atari.st
Date: 1991-06-29 23:26:37 UTC
From: azog@world.std.com
Message-ID: <1991Jun29.232637.27632@world.std.com>
Source record: 230778

Im looking for suggestions on how to cool my 520ST. I like to keep my computers turned on 24 hours a day, but I am nervous about doing this on my ST, as it gets real hot after a few hours (it also starts to get that overheated electronic smell. You know what I mean, a coupla notches below what an exploding transistor smells like :-)

Anyways. I could probably put it in a PC clone case, with modifications, as that has more than enough room for a fan. But I dont want to do that if I dont need to. The PC clone cases take up an awfully lot of room, and the ST case is nice and small.

Anyone have any ideas? Id like to keep it as "bulkless" as possible...

Thanx

Ok i'll listen, if you have the facts to support your claims.

> Since atari does not make the ST computer any more that I know of you must
> compare the capabilities of the STe to that of the amiga.

Ok, i'll give you that, but don't ever compare an Amiga 1000 either.

> A 1040 Ste compares VERY favorably to an amiga 500. The ONLY thing the amiga
> 500 has over the atari is the fact that the atari can not do as many colors
> on the screen at the same time...

Really? this is the ONLY feature? Since when does the STe have 25 DMA
channles? since when does the STe have a graphics co-processor capable of
running concurently with the CPU? since when does the STe have Multi-tasking?

> However there is a 24bit card available for $800 with a coprocessor of some
> sort for really good graphics...

just one? i can buy 3 or 4 24 bit graphics devices for the 500 for under
$500.00.

> Adding things to the ST come alot cheaper over all then on the amiga and the
> standard equipment atari sells is of better quality on average.
> Compare....

Really? what facts do you have to support this? why is it cheaper to expand
the STe? What items of CBM equipment can you *PROVE* are inferior to anything
Atari makes?

> An Ste with tos 1.6 and blitter performs pretty well...

IF any software uses that blitter. very little does.

> Compared to an Amiga 500 the amiga only has a slight edge over the Atari..
> (Note: for the price no other computer even comes close...)

Really? does the STe cost less than $500.00?

> Compare OS's... The St is built with a much more complete OS then ANY of the
> amiga OS's.. (The 2.0 doesnt really count at this point since last time I
> looked it was not available on amiga 500's yet)

Ok.. i won't count something because it's not available to everyone. But still the Atari's OS is hardly more complete. I have a book that attempts to do the same thing on an Amiga and an ST, and they had to supply a whole bunch of routines that had to be written from scratch to match what they used in the Amiga's OS.

> If you compare the amigas 2.0 to the Mega Ste's 2.x and the TT's 3.X the
> atari beats it hands down.

Oh really? why? comparisons? facts? i don't see any. Please supply facts to support your position.

> (Beats it in all areas of ease of use and of pure power...) Of course the
> amiga does multi task but I have very little use for multi tasking..

Oh! another feature that the ST lacks that the 500 has... i thought you said there was only one?

> (I use a 25 mhz '386 with desqview.. On the BBS multi tasking is nice..)
> VERY few people I talk to use multi tasking more then ocassionally.

But you said you had little use of multi-tasking! it seems that running a bbs and doing things is something you use multi-tasking for. NOBODY has any use for multi-tasking. that is until their computer can do it. then it becomes a necessity.

> As to sound? Well The ST is the only one so far that has the capability of
> 3d sound. The STe series computers have the capability of using 3 seperate

Oh really? hmm.. In a month or 2 (as soon as the board is released) i will be able to hook up 16 speakers to my amiga and have seperate sound coming from all of them. by the way, how's the quality on that third channel?

> speakers with different sounds out of each.... 2 of those full 8 bit
digital..

oh! only 2 are full(?) 8 bit digital. hmm are there any companies developing 16 bit audio boards?

> It is easy to use HD floppies on an ST.. I have yet to see on on an amiga...

There are 2 of them. the Applied Engineering 1.56 meg High Density, and the Commodore 1.76 meg High Density.

> Since the ST uses standard parts it is easy to get most of the items...
> Comparing an ST to an Amiga at purely CPU intensive things the Amiga can not

> be compared very favorably.

Oh really? and i suppose that there are numerous 020,030,and 040 boards
available for the STe? and a 50 Mhz 030?

> The amiga has a hand up on the serial port since the ST is limited to 19200
> baud...

hmm.. and *WE* amigans thought *OUR* serial ports were bad...

> ALL the memory can be used in an ST as compared to the amigas limitation of

> to games and higher resolution color work...

What do you mean by "wasting memory"? I do double buffered graphics, and i
don't waste memory. what's your definition of wasting memory?

> Start comparing at the TT to amiga 3000 level and the difference is alot
less..
> The TT can do some graphic modes the amiga would be jelous of and visa
versa.
> The sound systems are for the most part the same.. Differences can be over
> come by the speed of the processor. If you REALLY push it the amiga can do a
> few things better in the graphics arena though.. Over all though you have no
> bussiness stating the ST is no where as good as the amiga.. It is not true..

Oh, but we're not supposed to compare things that aren't available to
everyone. since when is a TT available in the US? if we can compare TT's
then we can compare workbench 2.0. Can you easily add an 040 board to a TT?
and the TT has it's version of Chip Memory as well. It's for performance, and
it only took Atari 6 years to realize that.

> However Atari USA is missing the boat....

An understatement if i ever heard one.

> Actually someone shot the boat they were on while they were sipping a toast
> to what they thought was going on... Then federated almost killed them..

> (Multi tasking doesnt make a better machine but since most people dont
> realize they are not gonna need it they think they need it and might lewt
> it make some sort of an effect on them..)

Huh? that last sentance was totaly incomprehensible. (sort of like
multi-tasking to ST users). I'd like to see some proof of all your
alegations. since everything you've stated is based purely on speculation on

your part and not facts.

853. 68000 socket adapter

Newsgroup: comp.sys.atari.st
Date: 1991-06-30 01:33:22 UTC
From: hyc@hanauma.jpl.nasa.gov
Message-ID: <1991Jun30.013322.26556@jato.jpl.nasa.gov>
Source record: 230782
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Howdy - could someone please remind me where to get an adapter for fitting
a standard DIP 68000 into the socket in an STe? (Not a Mega STe, if it matters.)

Also, a while ago, someone mentioned seeing a board for sale that adapted a
68020+FPU to run in a 68000 socket. I contacted the company, and found that
they make accelerators for Amigas. The 68020 product uses a 12MHz 020 running
off the standard system clock (e.g., 8MHz in ST) and an FPU running as fast as
you want, up to 50MHz.

I didn't get a price on this item... However, they sell other models of
accelerators - I've ordered a 25MHz 68030 for $600, to test in my STe.
It would be great if I could run it at 16 or 32MHz, but I guess I'm just
going to see if it runs at 8 first. Should be interesting.

Does anybody know where to find a screen dumper (hooks $502 or $506 or something like that) that will work with an Okidata OL-400? The manuals say its command language is HP-PCL, so a HP LJ-II screen dumper ought to work.

Thanks in advance.

855. Re: Incompatibilities with Overscan

Newsgroup: comp.sys.atari.st
Date: 1991-06-30 01:47:13 UTC
From: vsnyder@jato.jpl.nasa.gov
Message-ID: <1991Jun30.014713.26944@jato.jpl.nasa.gov>
Source record: 230784
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've observed the following incompatible things about using overscan.
I'd like to know if anybody has fixes or work-arounds for them:

1. The VT52 emulator (the one used for .TOS and .TTP programs) doesn't
scroll correctly. Once the screen fills, it just copies the bottom line
forevermore.
2. If I setup a desktop.inf to make my windows tall, and put some icons
(e.g. trash) far down the screen, and then re-boot with overscan off, the
icons are all on the screen, but the windows aren't. In particular, the
size box is off-screen. One CAN re-size by making the windows FULL, and then
dragging to the right size, but it would be easier if the desktop just made
sure it's windows would fit when they're opened.
3. TrboDemo crashes the system.
4. v_clrwk doesn't clear all the screen, and it somehow mahes what it DOES
clear jitter (a lot).
5. Uniterm doesn't work :-(.
6. OSCAN_60 doesn't let me run in either low or medium rez. The first
setup screen seems OK, the second (with the lines around and across the
screen) is a little screwy (the diagonal lines are triple, in different
colors), and when I finish setup, I've got hash. I'm using the one
called 1.6b. I forgot who "improved" it.

Other stuff I'm using includes:
VDIFIX version 30.01.91
PoolFix3, improved by Claus Brod, 27 Mar 90
Foldr 100.

Thanks in advance for any advice.

Hello everyone,

Sorry for asking something that has already come
up before, but who is distributing Turbo-C in the
US? I know the docs are in German, but that's
no problem because I read German just fine.

Thanks,
Jim

Let me get this straight....

You are going to run Unix, X windows and have a display of 1024x1024x8?

How much memory are you planning on putting in this beast?

Also, tell me what it would take to get the Amiga 500/1000 to
run Unix, X windows and have a 1024x1024x8 display.

>
>You are going to run Unix, X windows and have a display of 1024x1024x8?
>
>How much memory are you planning on putting in this beast?

The A3000UXD comes with 9mb of ram. The A2410 card has VRAM onboard
(I don't know how much) so the X display runs on the board, not in the
A3000's memory.
The A3000UXD already runs Unix (SysVR4) with X11R3, but it's
B&W and X11R3 is slow. Unix2.0 will have X11R4 which will use the A2410.

>Also, tell me what it would take to get the Amiga 500/1000 to
>run Unix, X windows and have a 1024x1024x8 display.

It would take a lot. Unix needs an MMU so you need atleast
68020, 8mb of ram, a fast hd. To use the A2410 (1024x1024) you need
atleast an A2000(because the 500 doesn't have a Zorro II slot)
In the end, you'd pay more for an A500+Cpu Card+Ram+HD+Unix+Expansion
chassis+A2410. The A500 only costs $400, and a good Unixx system costs
>$3k so there's no point upgrading an A500 to run Unix. The A500 is only
a low end machine. Re-direct any future questions to comp.unix.amiga or
comp.sys.amiga.introduction.

Who cares? That's like asking what would it take to turn
a PC XT into a file server for an Ethernet LAN with 100 machines.
It is pointless. You buy the machine appropriate for your needs.
Of course, you CAN get that A500 to run X-Windows on a 1024x1024
4 grey-scale monitor under AmigaDOS.

>Ha! Are you joking? Our book won't cover Atari's UNIX. Simple reasons:
>(1) it's not finished
>(2) this would need another ~1500 pages
>(3) hopefully ANY good Sys VR4 book will do the job!

OK. The 1 Mbps(?) MICROWIRE bus should be documented though, since it is able to supposedly address (and network?) multiple devices. An example of a device driver program would be nice too. Schematics and identification of the major chip pins and their timing would make your book popular with the Atari Service Centers.

I read that Ira Velinsky was the principal architect of one of the machines and it would be interesting to read an interview regarding him and the other designers. Their insights of the features, limitations, tradeoffs and the general design philosophy of the STe/TT series might give hints about future products.

Anyways, 1500 pages is pretty hefty and I was wondering if publishing two volumes would be feasible. German words appears to be about 20% longer than English, so a translated version would undergo an automatic compression!

You should also consider emailing excerpts of your book to Znet and ST Report.

Well go get the Doc file 2_5ram.zoo at atari.archive, also there is
one on Genie.
These will help you with a home brew upgrade.
with a home brew you can use sipp/simms and 9 bits will all upgrades,
Note: you must diable the parity bit, connect the inputs to VCC.

Message-ID: <4041@quepasa.cs.tu-berlin.de>
Source record: 230799
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

In article <1991Jun30.014713.26944@jato.jpl.nasa.gov> vsnyder@jato.Jpl.Nasa.Gov (Van Snyder) writes:
>I've observed the following incompatible things about using overscan.
>I'd like to know if anybody has fixes or work-arounds for them:
>
>1. The VT52 emulator (the one used for .TOS and .TTP programs) doesn't
>scroll correctly. Once the screen fills, it just copies the bottom line
>forevermore.

This is an error in the OS. Scrolling only works if the bytes per line value diveded by 16 does not give a remainder. With the new AutoSwitch-Overscan the bytes per line value is 96 in mono or 224 in the color resolutions, so there is no scrolling problem.

>2. If I setup a desktop.inf to make my windows tall, and put some icons
>(e.g. trash) far down the screen, and then re-boot with overscan off, the
>icons are all on the screen, but the windows aren't. In particular, the
>size box is off-screen. One CAN re-size by making the windows FULL, and then
>dragging to the right size, but it would be easier if the desktop just made
>sure it's windows would fit when they're opened.

This again is a problem of the OS. It was fixed in the new TOS-version. You get the same problems, if you save your Desktop.Inf in high-res and reboot in low-res.

>3. TrboDemo crashes the system.

If you mean a demo of TurboST, then you are right. TurboST does not work with overscan. QuickST works, but has some problems with the TOS scrolling (fillding with the right black border). Darek is working on it (I hope so ;-). The NVDI software has no problems with OverScan or AutoSwitch-OverScan.

>4. v_clrwk doesn't clear all the screen, and it somehow mahes what it DOES
>clear jitter (a lot).

This is a very old bug, that is fixed in the autoswitch-OverScan driver. There were about 52 versions between the old PD/ShareWare version of OverScan and the new driver.

>5. Uniterm doesn't work :-(.

AutoSwitch-OverScan switches back to the normal screen, if you start incompatible programs. So you can use lots of 'old' software that did not work with the overscan mod.

>6. OSCAN_60 doesn't let me run in either low or medium rez. The first
>setup screen seems OK, the second (with the lines around and across the
>screen) is a little screwy (the diagonal lines are triple, in different
>colors), and when I finish setup, I've got hash. I'm using the one
>called 1.6b. I forgot who "improved" it.

The autoswitch-OverScan driver works in all resolutions.

>Other stuff I'm using includes:
>VDIFIX version 30.01.91
>PoolFix3, improved by Claus Brod, 27 Mar 90
>Foldr 100.

The driver includes most of my patches (VdiFix, Tos14Fx5, GemEnv, Shell0,
ConsFix), so you don't have to load them in the auto-folder. If you don't
want the patches, you can disable them.

AutoSwitch-OverScan will be available in the US in the near future, we
have already contaced some dealers for the distribution. In the UK you
can by AS-OverScan at Atari Workshop.

>Thanks in advance for any advice.

I could not give you any direct hint how to get rid of your problems, but
i hope i explained why the things happen in this way...

>vsnyder@jato.Jpl.Nasa.Gov

>++ or an HP Deskjet?
>
>See above.
>
>If dot matrix = Epson then yes.
>If printer = HPDJ or HPLJ then yes.

i just downloaded (at 2400 baud :-( ) ghostscript yesterday to try it with my Epson LQ-1000. it works well. however, there are a few things to watch out for:

1) the print program, pr.ttp, sends what appears to be an eject for {desk,laser}jets at the end. this code happens to correspond to user-defined characters on Epson. remove it. send "ESC @" or formfeed instead.

2) at least on my LQ, each bitmap file sends an escape for 8/60th inch line spacing. this leaves a gap. you want 6/60th inch. again, i just hacked pr.c to read first 20-30 chars first, looking for the "ESC A 8" sequence and changing it to "ESC A 6", then read the file normally. the interline spacing sequence always seems to appear near the top of the prn_1xxx file (at least on the 4-5 files i tried). i also took out the ioctl on stdin since i did not use gcc to recompile.

3) the full ghostscript distribution (i found v2.2 on uunet.uu.net in the gnu directory there) contains fonts. helvetica and times roman seem ok, though times also seems to be missing some chars in the set (non-alphanum chars). you need 2-3 MB for the full font set available.

4) gs epson driver does not make use of the higher density graphics modes on the LQ and uses single density (8-pin) mode. crude, and not very effective for font sizes below about 16 pts. there is no way around this short of redoing the epson driver in gs itself.

5) interesting side note: good ol' arc 5.21 compresses the .gsf font files SMALLER than lharc (the unix versions i have, anyway). :-)

other than that, gs seems excellent so far. enuf to make me want to finally replace/augment my aging 24-pin with the deskjet! kudos to the original autors and the ST porters...

I'm sick & tired of this nonsense. I don't know what is the problem of the Amiga users who ocasionally post childish messages to this newsgroup, but most of us don't give a damn about ANY Amiga machine.

I don't wanna know the PROS and CONS of the Amiga...when, and if, I do I'll let you know. In the meanwhile leave us alone.

I'd also like to ask from the few ST users who participate to this silly (IMHO) discussion, to either ignore them, or continue arguing via personal e-mail.

thanks

>what happened to the atari panther ?

Depending on which rumor mill you subscribe to, it's either been cancelled, or renamed the "Jaguar", a 32-bit 68030 system ("Atari introduces the world's first 32-bit game system!") that's backwards compatable (so the currently-developed Panther software will run) but offers more features.

Notice that both rumors are not mutually exclusive...

880. Help! -- SupraModem 2400+ Flow Control

Newsgroup: comp.sys.atari.st
Date: 1991-06-30 19:48:45 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <y8DD51w164w@ersys.edmonton.ab.ca>
Source record: 230711

Does anyone know how to use the SupraModem 2400+ with Zmodem? I have
been able to use it fine with Ymodem-G for downloading, but there is no
version of Ymodem-G that supports uploading. The fastest protocol I know
of that does support uploading is Zmodem, yet I can't make it work with
the modem. My modem is connected at 9600 BPS to the computer as the
manual says it should, and I have Interlink set up to use RTS/CTS Flow
Control. It works fine online. When I try to download something, I
execute RZ 3.0 and that seems to work okay. When I use SZ, though, I get
superfast sending for a while and then it repositions itself to 1K
offset. It repeats the fast sending for a while, and then repositions
itself to 2K offset. It continues in this manner until I abort. Ymodem
uploads (from Interlink) work okay, but they are *SLOW*. I think the
problem has to do with no Flow Control support in Zmodem, but I get a
smilar problem with DTerm. I have Tos 1.4. I also tried installing a
program called Turbo CTS (it had no docs, but what harm could it do?)
with no affect. I hope someone can help me out with this problem.

>commodore die-hards. Great! This is comp.sys.atari.st not comp.sys.amiga.*
>and these little battles and irritating posts do NOT belong here. Who is in
>charge of this news group anyway? Usually I read down through every article

Well the problem comes about that someone was posting an informative message
that Atari users took as a personal attack (insecurity?) and they responded
with tons of lies/misconceptions/propoganda/falsities about the Amiga. now,
no self respecting Amigan is going to let other people lie about his favorite
computer, thus we get Amigan's trying to correct the mis-information and it's
construed as a Computer war. When in reality, it's just some nice Amiga
people trying to prevent the spread of false information. If you don't want
to read about it, then send mail to the people who are spreading the false
information, and most of the Amiga posts will stop.

882. 640x800 on SM 124 with STE

Newsgroup: comp.sys.atari.st
Date: 1991-06-30 23:18:52 UTC
From: larserio@IFI.UIO.NO
Message-ID: <CMM.0.90.2.678323932.larserio@kvart.ifi.uio.no>
Source record: 230712

Posted to comp.binaries today....

Two small 640 x 800 screen emulators for STE and SM124 or SM125
""

640x800n.prg A standard big screen emulator except that it only
""""""""""""" scrolls up and down as you move the mouse outside
the upper and lower edges and takes up only 64 K.
The 640x800 resolution is great for programs like
Calamus DTP, Timeworks DTP, CAD programs etc etc
TOS and text-based applications still use only
the upper half 640x400 as this gave the best
results with most of the programs I tested :-)

640x800i.prg This program uses INTERLACE to display 640x800
""""""""""""" on a standard SM124 with no up/down scrolling !!!
It flickers some (no way around that without
a hardware modification), but if you adjust your
brightness and contrast it's better than Amiga :-)

Installation Both programs should be in the AUTO-folder (but
""""""""""""" not both at the same time). During a normal boot
they will NOT install. To make them install you
must hold down one of the SHIFT keys during boot.
The programs need a STE or a MEGA STE to work !!!

Call me at: +47 2 13 15 71 (voice)
or ABK-BBS: +47 2 13 26 59 (1200-9600 BPS MNP5)

883. Atari-Amiga wars

Newsgroup: comp.sys.atari.st
Date: 1991-06-30 23:22:13 UTC
From: revpk@cellar.UUCP
Message-ID: <q4ND51w164w@cellar.UUCP>
Source record: 230713

Someone above posted abouthow tired they are of Amiga users coming to
this newsgroup to crow about their machines.

I agree-- there's no need for this at all. I don't know how often
Amiga users go onto Mac or IBM newsgroups, and crow over there, but I'd guess
it's a LOT less. (Maybe it's just harder to defend the Amiga against the two
industry leaders.)

But I'm not aware of too many Atari ST users going onto the Amiga
echoes and disrupting their discussions. Maybe I'm wrogn about this-- I
haven't checked out the Amiga sections-- but I'd be genuinely surprised
should such things happen with as much frequency as they do here.

So, here's a proposed remedy; if anyone wants to, they should take
the my-Amiga-kicks-ass posts, and re-post them on the Amiga newsgroups with
the following note attached:

"Until the Amiga user who wrote this message learns some common
courtesy, his obnoxiousness should be shared among all. If you don't want
these messages on your newsgroup, then kindly tell him to stop."

It's not the nicest thing to do, I admit.

Well... This may be considered not in good taste, but what the hell...
This is one mans testiment to Atari. Ive posted before about this, but
seeing the people touting how great the Amiga is, and how bad the
Atari is, and seeing that theres Amiga people who read this newsgroup,
it cant hurt.

Im fairly new to Atari land. I got a used 520STfm about a month or so
ago, and really liked it. Now I see all these message about the
Amiga, and said to myself 'Hey, the Amiga is a good machine, maybe
Ill switch over'

So I thought for a few days, and came to my conclusion. When I get some
spare case, Im gonna upgrade my 520STfm to a Mega STe :-) Being new
to the Atari way, Im easily swayed when people say all bad things about
the Atari, and all the good things about the Amiga. Fuck it. I like the
Atari, and Im gonna stick with it. The only reason Ill give up my
520STfm is so I can get some of the neato features that the STes have,
like a higher version TOS, and the like.

Amiga has multitasking, and Ill tell you right now: I _dont_ need it.
How can I be so sure? Well, put it this way. I work on a VAX 6220,
with 128mb of RAM and over 3gb of disk space. It has duel processors,
and can support over 200 processes. We dont have over 200 users, so
I cant say how good itll do over 200, but I suspect our VMS license
is only 256, so the point is moot. Anyways, compared to this, the
Atari _and_ the Amiga is a toy, OK? VMS is a real multitasking system,
fact.

Anyways, my point is this: why point out all the good things about
the Amiga, when most of the people in comp.sys.atari.st dont care?
I sure dont. Im gonna hang with my ST. Im sure that there were a
few people over the years who swayed towards Amiga, but look at it
this way, if theyve been Atari fans this long, what is gonna
make them go away now? Considering the huge investment in equipment
that most people have? I got my 520STfm and monitor for $250, and got
a cordless mouse for $100. If I find a cheap enough Mega STe, I can use
my monitor and mouse on that, so I figure that maybe Ive lost about
$100. Oh, Ive got an external floppy that can migrate too. And I might
even be able to sell the unused 520, who knows?

So anyone know where I can get a cheap Mega STe? :-)

Can any of the UK, or otheres inform me on the availability
of Ataries ? Hard Disk Archiver program that I read about
so much last year in the UK, magazines.

Also has Atari released there Hard Disk Optimiser program,
or will it ever be released.

Have you in installed TOS 1.4, or even better the Patched version
from atari.archive, tos14fx5.lzh.

There is a bug in tos 1.4 that will stop rts/cts flow control.

889. codehead ed

Newsgroup: comp.sys.atari.st
Date: 1991-07-01 02:53:32 UTC
From: chuck@mrcnext.cso.uiuc.edu
Message-ID: <chuck.678336812@mrcnext.cso.uiuc.edu>
Source record: 230719

this from the latest znet:
.....

CODEHEAD ED:

Included as freeware with CodeHead Utilities is CodeHead's special desk
accessory version of MicroEMACS, the popular progammer's text editor.
At CodeHead Software, we've been using CodeHead ED for years. Now you
too can access the power of EMACS as a desk accessory. CodeHead ED uses
the GEM file selector for loading and saving files and has been
optimized in many other areas to help make your text editing tasks as
easy as possible. You can bind commands to different key combinations
to customize it to your own preferences, and the powerful EMACS command
language lets you create macros and command routines to do extremely
complex tasks.
.....
I assume that freeware means freely distributable
does anyone have this, and could they post it or send me a copy?

Best Products
2021 The Alameda, Suite 290
San Jose, CA., 95126-1127
Phone 408-243-6950

Has a real little fan, that is a replacement for that in the Mega2/4 and has a higher air flow. Its 12v, has 13" leads and 1 9/16 x 1 9/16 x 13/16. Center to center square bolt pattern is 1 1/4 in. $12.00. Should be easy to install if you are handy with a soldering iron, etc.

They have parts for almost any Atari product ever made, plus some stuff that is uniquely theirs, like the 'BEST' mouse, the 'BEST' joystick, etc. plus they carry parts for all the stuff they sell so it can be repaired instead of replaced.

891. Re: Panther

Newsgroup: comp.sys.atari.st
Date: 1991-07-01 03:57:41 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <9107010357.AA17465@cwns5.INS.CWRU.Edu>
Source record: 230721

The Panther project is supposely now dead.

The Panther was originally going to be a 16-bit hot shot video game system
to knock the Super NES and the rest of them out of the water early next year.

The problem was the time.

By the time Atari released the Panther, the Super NES, Genesis, and Turbo-16
would have most of the market.

Even with a little better games, it is the same old story with the Nintendo,
Sega Master, and 7800.

Atari has decided to leap frog them all and release a 32-bit video game
system instead. Some even say Atari will release a 24-bit as well.

But the president of Atari Corp.'s Entertainment Division stated that the
32-bit will indeed be a reality early next year. He stated it in one of the
video game publications when answering a reader's letter.

I wonder what the price would be on that...

P.S. - if someone could inform AtariUser of this, it would be appreciated!
They should really call the Atari Entertainment Division to make sure but
I believe these are facts.

Source record: 230607

Hello,
I'll be getting a TT in a few weeks (:-), and I still have time to
think about the monitor. A friend showed me his Seiko 1445 for the Mac, and
that is one *top-notch* display (albeit 640x480). I've been looking at
specs for the Seiko 1450 (the *BM version), and it's 1024x768 non-i'lace.
About the same price, too. I am seriously considering 24 bit cards, and
my basic frame of reference is graphics work (render, model, etc...).
Please deluge me with opinions on monitors. Info on 24-bit cards that are
shipping in the North American (pref. US) market *right now* would be
helpful. General TT messages are ok to send to me.
Bob The (nosig) Schulze

If you don't need multitasking, why are you using it?

898. Publishing Partner (w/SG10)

Newsgroup: comp.sys.atari.st
Date: 1991-07-01 12:47:41 UTC
From: yonder@netcom.COM
Message-ID: <1991Jul1.124741.16156@netcom.COM>
Source record: 230729

I have Publishing Partner (a vintage copy -- did they ever make an upgrade?). Anyways, I wanna use it with my SG10. The readme files says to set the printer to IBM mode and use the MX80 driver. I tried this. I tried the FX80 driver. I tried the Gemini driver with the SG10 in Star mode. It prints "something" out in any of these modes. Unfortunately only the largest of letters seem to print out correctly.

For example: on the example (tutorial) document the title "Publishing Partner" prints out ok in all of the above meantioned modes. I think the point size is about ~30 or so. The smaller text (~14 pt and less) all prints out very fragmented.

It is an old version of the program that was sold to me with my ST. I had kinda always told myself I would try it out "real soon now". It looks to be a pretty good rudimentary page layout program. Is it still used much? SoftLogik Corp. still around?

With the standard MMU, it's a 4 MB limit. With a more intelligent memory
expansion card, you can stuuf 12 MB of RAM into a standard Mega ST.

>No, the ST memory is limited to 4 meg... (Same as chip memory as opposed to
>fast memory.. The TT uses the same type of setup memory wise as the Amiga..
>CPU ram is VERY fast and is unlimited in theory.)

I think Allan Pratt mentioned that the TT's slow RAM is limited to 10 MB or
something like that. Am I wrong?

>*IF* any software uses that blitter. very little does.

Every program that draws on the screen using OS functions (i.e. virtually
every program except some games) will profit from blitter speed because
TOS uses the blitter to speed up the output.

>Oh really? and i suppose that there are numerous 020,030,and 040 boards
>available for the STe? and a 50 Mhz 030?

You're right to suppose that there are 020 and 030 cards for the ST 8-)
I haven't seen a 040 board yet.
>
>and the TT has it's version of Chip Memory as well. It's for performance, and
>it only took Atari 6 years to realize that.

Please try to understand that it's a different job to make a computer run
with 0 waitstates that has a 8 MHz 68000 than to do this feat with a
32 MHz 68030 that uses burst mode to access RAM. Giving us 0 waitstates
on the standard ST was an excellent hack from Atari, pushing the design
to its limits. Remember the Amiga design didn't _quite_ manage this?
Changing the design for the much faster TT is no sign of surrender as
you would like to put it - just a architectural necessity.

Source record: 230663

In a message of <24 Jun 91 19:46:49>, freds@hpspdla.spd.HP.COM (2:320/100.1) writes:

f> What is the difference between the MEGA ST and the STE?

There are two STE's, the 1040 STE and the Mega STE. The 1040STE looks like an ordinary 1040ST except for the two addidtional joystick/paddle/lightgun/lightpen ports at the left side and the two connectors for connecting the STE to you HIFI. Here follow some specs.:

- TOS 1.06 or the newer 1.62. (which should be 1.062, actually)
- OS contained in 256Kb ROMs.
- Contains Blitter chip.
- Color palette of 4096 colors.
- Hardware support for horizontal and vertical scrolling.
- Prepared for an external Genlock-interphase.
- 8-bit stereo PCM-sound. Programmable sound generator.
- 1 Mb RAM, expandable to 4Mb using SIMMs.

The Mega STE looks like a TT, only it is grey and not white.

- The Mega STE has all the facilities the 1040STE has, except for the extra joystick/etc. ports! (please explain, Atari...)
- 16Mhz MC68000 CPU with 16 Kb cache. 8 Mhz/16 Mhz without cache/16 Mhz with cache can be set by the control panel.
- Socket for the MC68881/82-16 Floating Point coprocessor.
- 2Mb or 4Mb RAM (SIMMs) There are rumors about a 1Mb version, but they have not yet been comfirmed. Memory can be expanded by placing SIMMs on the motherboard or by using a VME adapter.
- Hard Disk 3.5'' 48Mb 28ms. This is a SCSI hard disk, so the Mega STE has a host adapter. It has no external SCSI ports, only one ACSI port.
- Real time clock like in the Mega ST.
- 2 RS232 ports
- 1 LAN 1Mbit/s port
- Internal connector for VME-bus Rev. C. 1
- Internal Fan (2) for hard disk and motherboard
- 'TT' desktop
- A far better keyboard than the Mega ST's

f> Can a MEGA ST be upgraded to the STE? What does Atari have
f> to say on this subject?

No way. The soundhardware is too different and the STE's have hardware scrolling capabilities which cannot be implemented onto a Mega ST. The Mega ST's ROMs aren't 1Mbit chips, the STE's are. The differences are just too large.

f> I have tryed to sell the system, but I have had no real offers. I
f> had buyers for the monitors, and one piece of software. I guess no one
f> likes the old MEGAs.

Yes, you are out of luck. Lots of people are selling whole systems including
Mega ST's, hard disks, printers. etc. because they want to buy a Mega STE or
TT. There are just too few people who want to buy 'older' systems.

Source record: 230733

Hi there. I recently defected to the PC world, and would like to
free up some desk space by selling my ST system. It includes:

1040 ST w/1 Meg RAM and DS/DD drive and mouse
Color and BW monitors
LOTS of games software, including:

Alternate Reality - City
Arcticfox
Arkanoid I
Arkanoid II
Autoduel
Battlezone
Blasteroids
Breach I
Breach II
Captain Blood
Championship Wrestling
Chessmaster 2000
Death Sword
Defender of the Crown
Empire
Gauntlet
Gauntlet II
Hacker II
Heroes of the Lance
Hostage
Indiana Jones and the Temple of Doom
Mercenary
Metrocross
Oids
Populous
Road Runner
Silent Service
Star Quake
Star Trek - Rebel Universe
Super Hang-On
Time Bandits
Warlock
Xenon
and many more that have temporarily slipped my mind.

Also some 'serious' software:

Laser C compiler
Cyber Paint
Tempus II text editor
Flash!
Shadow

and also several ST programming books and LOTS of STart magazines,
most with the companion disk, and some public-domain stuff such as several
good games, Degas and Neo art files, BBS numbers, etc.

Whew! Didn't realize that I had so much. As for the price: I
would like to get around $700, but if you have a reasonable offer, please
talk to me. Also, if you want individual pieces, make me an offer, but I
have to give priority to package deals.

Waiting for inquiries,

John Gordon

906. Elvis Inserts Newlines in my Files

Newsgroup: comp.sys.atari.st
Date: 1991-07-01 15:39:00 UTC
From: dmb@wam.umd.edu
Message-ID: <1991Jul1.153900.9920@wam.umd.edu>
Source record: 230734

I've been using Elvis (a vi clone) for quite some time now, but just recently discovered that the version I have (from atari.archive) sometimes inserts newlines at seemingly random points in large files. Since most of the work I do is on source code with < 32K source modules, I never noticed the problem until now.

Anybody know of a fix for this problem, or have a newer version of Elvis? I've tried Levee too, and would use it except for the 32K file limit. (Is there a more recent version of levee without the 32K restriction?)

Thanks,

Dave Baggett
dmb@wam.umd.edu

907. Unix Windows....

Newsgroup: comp.sys.atari.st
Date: 1991-07-01 16:07:30 UTC
From: yonder@netcom.COM
Message-ID: <1991Jul1.160730.4841@netcom.COM>
Source record: 230740

I read a message not too long ago that meantioned a UNIX windowing
interface called Unix Windows that would run on the ST. I was
very interested so I ftp'd it over from atari.archive.

My problem: it don't work :-)

First I ran win.prg on the ST. Boy, looks nice. I kinda had the idea
I would be able to use it to make the connection to the remote system
but all I get is a blank window (the pull downs and everthing works).

My next step was to compile the server program (uw) on the SUN system
that I use. Then I ran the uw program.. whew, no core dump.

Crossing my fingers, I exit my term program (uniterm) and run win.prg.
Still, I get nothing. The RS232 setup is correct. It tells me the
UW is not running whenever I try to open a window.

I cannot type in any of the windows on the screen. I fear that the problem
might be that I am trying to run the program on a color system. One of the
readme's said it would only run on mono systems. Is this a case? Is there
a fix? Am I doing something totally wrong (likely).

Please help... thanks....

908. VIDEO GAME RATINGS REPORT [ATARI]

Newsgroup: comp.sys.atari.st
Date: 1991-07-01 16:08:26 UTC
From: erc@radon.berkeley.edu
Message-ID: <42517@ucbvax.BERKELEY.EDU>
Source record: 230735
Cross-posted to: rec.games.video,rec.games.misc,comp.sys.atari.st

For information on the list format and on submitting your ratings, see
the end of this posting and the article entitled "ABOUT THE VIDEO GAMES
RATINGS REPORT" in the newsgroup rec.games.video.

If you "reply" to this article, your message will most likely go
directly to the video games ratings server, which silently ignores
everything which is not a vote.

In this list, games have been rated on a scale of 1 to 10, 10 being the best and 1 being the worst. For each game, the total number of votes, the average rating, and the vote distribution are shown. New games are indicated by a "*" before their entry. If a "(C)" appears after the title it means that the game is a CD-ROM or disc system title. If a "(J)" appears after the title it means that the game is currently only available in Japan.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested
in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

The vote distribution uses a single character to represent the
percentage of votes for each ranking. The following character codes can
appear:

"." no votes cast "3" 30-39% of the votes "7" 70-79% of the votes
"0" 1-9% of the votes "4" 40-49% of the votes "8" 80-89% of the votes
"1" 10-19% of the votes "5" 50-59% of the votes "9" 90-99% of the votes
"2" 20-29% of the votes "6" 60-69% of the votes "*" 100% of the votes

Please consult the article entitled "ABOUT THE VIDEO GAME RATINGS REPORT"
in the newsgroup rec.games.video for more details, including information
on how to vote.

Questions, comments, problems, and errors should be directed to the list
maintainer at either of the below addresses:

In article <1991Jul1.141138.7331@athena.mit.edu> ckb@athena.mit.edu (Christopher K. Brown) writes:
> Yeah. Right. Nice Amiga People. Why would anyone with an Amiga
>EVER read this newsgroup. It makes ABSOLUTELY NO SENSE. I don't even
>know what the comp.sys.amiga.* newsgroups look like. They could come up

1. Who says it has to make sense?
2. Do you have an end-all be-all solution to what makes sense?
3. It makes rather much sense(IMNSHO). I think it is known as broadening your knowledge. It is also fun watching the 'competitors'; you should know your enemy before engaging battle(though I am getting a bit tired of all the flame-wars. Come over to c.s.amiga.advocacy if you fancy some fresh flaming).

4. It would however be out of line to discuss Ataris and Atari-stuff when you don't own an Atari yourself. That's why I've been reading this newsgroup for 2 years without you noticing. I'd even read the PC, MAC, and nExt groups if I had more time.

910. VIDEO GAME RATINGS BALLOT [ATARI]

Newsgroup: comp.sys.atari.st
Date: 1991-07-01 16:28:48 UTC
From: erc@radon.berkeley.edu
Message-ID: <42525@ucbvax.BERKELEY.EDU>
Source record: 230738
Cross-posted to: rec.games.video,rec.games.misc,comp.sys.atari.st

To use this ballot, just hit "R". Once in your editor, insert your game rating between the word "vote" and the system code and game title. Your rating must be an integer between 1 and 10. There must be at least one blank on either side of your rating. Make sure the word vote appears at the start of each rating.

If you do not want to rate a particular game, just DELETE THAT LINE FROM THE BALLOT. When you are finished, SAVE THE FILE, and exit the editor. The votes will be sent to the game rating tabulator.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

If you want to vote for additional games, just add them at the end, in a format similar to the existing entries. Be sure to include the system code right before the title. This code is one of the below:

AL = Atari Lynx AM = Commodore Amiga
GB = Nintendo Game Boy GG = Sega Game Gear
GS = Apple II GS MA = Apple Macintosh
NE = Nintendo NES and Famicom NG = SNK NeoGeo
PC = IBM PC, PS/2, and compatibles SG = Sega Genesis and MegaDrive
SF = Nintendo Super Famicom ST = Atari ST
TG = NEC TurboGrafx-16, TurboExpress,
and PC Engine

Thanks for participating in the rec.games.video ratings poll. (This text was adapted from Chuck Musciano's rec.arts.movies ballots and John Leo's rec.games.video ballots.)

PLEASE DELETE TITLES WHICH YOU WILL NOT BE VOTING FOR.

912. 640x400 for STE with COLOR MONITOR

Newsgroup: comp.sys.atari.st
Date: 1991-07-01 17:33:20 UTC
From: larserio@IFI.UIO.NO
Message-ID: <CMM.0.90.2.678389600.larserio@kvart.ifi.uio.no>
Source record: 230741

```
Two small 640 x 400 screen emulators for STE and COLOR SCREENS
""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""

640x400n.prg A standard big screen emulator except that it only
""""""""""""" scrolls up and down as you move the mouse outside
the upper and lower edges and takes up only 64 K.
The 640x400 resolution is great for programs like
Calamus DTP, Timeworks DTP, CAD programs etc etc
TOS and text-based applications still use only
the upper half 640x200 as this gave the best
results with most of the programs I tested :-)

640x400i.prg This program uses INTERLACE to display 640x400
""""""""""""" on a standard TV with no up/down scrolling !!!
It flickers some (no way around that without
a hardware modification), but if you adjust your
contrast and use 60Hz it's better than Amiga :-)

Installation Both programs should be in the AUTO-folder (but
""""""""""""" not both at the same time). During a normal boot
they will NOT install. To make them install you
must hold down one of the SHIFT keys during boot.
The programs need a STE or a MEGA STE to work !!!

Call me at: +47 2 13 15 71 (voice)

>a fix? Am I doing something totally wrong (likely).

As usually, you were doing something totally wrong. It only runs on
monochrome systems. I had this EXACTLY :-) same problem. You need to
run a monochrome emulator first -- then it will run fine. Unfortun-
ately the display aint going to look so hot. Pretty nifty though.

To all who missed out, this started when a snivelling little shithead fuck named Thomas Hill posted a rambling Amiga boast with the intent of starting a flame war. The fact that he posted a message about it on an Amiga newsgroup shortly thereafter inviting people to "join in the fun" proves this.

This Erik person apparently decided to "join in". There are others.

Attempts to justify the original post are laughable. Hill claimed first that 10 people (and one day later, interestingly enough, 20 people) responded to his post seeking asylum in Amigaland. Yes, that's right, he claims that there are 20 people who have usenet access, and considered buying Amigas, but to whom it never occurred to go to one of the dozen Amiga newsgroups and ask questions.

Frankly, it was fun flaming you weenies for a while. But now you've become rather tiresome. From now on this discussion will take place in YOUR newsgroup, not ours.

Which is too bad, because most Amiga users I've met have been good folks. Well, you started it. You can have it back.

The ZIP file format is originating from PKZIP on PC (no source but a
description of file format and algorithms used). STZip is written for, guess
what, Atari ST !!
It certainly won't port to unix (Modula-2 & 68000), but a portable UNZIP in C
has been posted in comp.sources.misc a few months ago, and a portable ZIP will
be posted in a few weeks (see Info-Zip@wsmr-simtel20.army.mil for infos,
betas, flames etc).

918. Help needed with floppy upgrade...

Newsgroup: comp.sys.atari.st
Date: 1991-07-01 20:22:45 UTC
From: umhagma1@ccu.umanitoba.ca
Message-ID: <1991Jul1.202245.11609@ccu.umanitoba.ca>
Source record: 230750

Hello all. I need some help with my upgrade to a 720K drive. I currently have a 520 STfm which I have upgraded to 1 Meg, but it still has the old 360K (Single Sided) drive, which is quite flakey. I have been told that I can use just about any 3.5" drive in place of the old one merely by swapping the cables. Is this true? I have already tried this and it does not work for me. Am I missing something? I would greatly appreciate any help in this area since I have not seen anything recently pertaining to a floppy upgrade in comp.sys.atari.st. Please send email to UMHAGMA1@CCU.UMANITOBA.CA.

Thanks much.
Brett.

919. DOUBLE

Newsgroup: comp.sys.atari.st

Message-ID: <CMM.0.90.2.678404386.larserio@kvart.ifi.uio.no>
Source record: 230747

Please forget about the 4 bigscreen emulatores posted yesterday
There is nothing wrong with them, but since they are so equal I
decided to build everything into one small and neat program !!!

PLEASE NOTE THAT THIS PROGRAM ONLY WORK WITH STE or NEWER !!!!!

Double Screen-Heigh emualtors for STE, MEGA STE (and TT ??)
"""

To install DOUBLE.PRG just put it in your auto-folder as early as possible
(and be sure it's before Quick-ST etc). When the computer boots DOUBLE.PRG
will NOT install itself unless you are holding down one of the SHIFT keys.
If installed in mono it will emulate a 640 x 800 screen (double height) and
if installed in color (desktop.inf must be medium res) a 640 x 400 screen.
Text based program (TOS etc) will still use only the upper half of the
screen (the normal area) as this worked best with the programs I tested.
Most GEM based programs will use the whole screen (I made it for use with
Calamus DTP and Timeworks DTP, but many many more programs can use it...)

RIGHT-SHIFT while booting --> Up/Down scrolling emulator
""

When you move the mouse close to the top or bottom of the visible screen
area the screen will scroll down or up to display more of the screen.
Think of the monitor screen as a window showing a part of the whole area.

LEFT-SHIFT while booting --> Interlaced screen display
""

This will double the number of lines WITHOUT having to scroll the screen
by condensing the screen display. This mode will flicker some (users of
color monitors or TV should use 60 Hz) but you might get a better result
by adjusting brightness and contrast (yes, it looks like an Amiga :-)

Message-ID: <1991Jul1.172711.21104@doug.cae.wisc.edu>
Source record: 230601

If you people really want to argue and lose about a great machine,
lets argue about the relative cost/performance merits of Atari TT's
and the NeXT Station currently reviewed in BYTE Mag.

Looks Like NeXT has got the phrase "Power without the price." Down to a
surface mount science.

I own an Atari, Christ I right a lot of software for the machine, PD
and personally I think the machine is something from 1985.

Atari is caught in the same old stone age architecture as InTEL's 486
chip.

Even if you where to argue that the current architecture targets a
specific HOME market, it STILL costs too much!

Atari missed the boat, they should have made an entirely NEW modular
machine. Soon as I get the money, my MEGA STE is going to sit and
either run MAC software or my BBS software.

I am going to buy a real machine, and its going to be a 040 UNIX
platform.

>modules, I never noticed the problem until now.

I've noticed this too on large files. I'd be VERY interested in a fix.
Also, to make Elvis work under MiNT, I had to ensure files existed before
I editted them (via a script) also, the ":n" didn't work. I used MiNT's
excellent debugging trace option (AltF1 ?), and discovered that it is Elvis'
fault - it does illegal things when openning files.

>yonder@netcom.COM or clr40@amail.amdahl.com or chrisr@leland.stanford.edu

Hi Christopher,
If I remember correctly (boy, what a disclaimer!), the SG10
has both an IBM mode and an Epson mode; for you to use either the MX80 or the
FX80 printer drivers, the SG10 will need to be in the Epson mode. Using the
IBM mode on the SG10, you should use the IBM Proprinter driver (if there is
one).
Yes, Publishing Partner has been upgraded to PageStream (of which, the
latest version (2.1) is about to be released any day now). Yes, Soft-Logik
is still around (and doing well!); you can reach them at the following address
to ask about upgrading:

(Ooops! I cannot find the address, but here is the toll-free phone number)

Soft-Logik Publishing Corporation
800/829-8608

Good luck Chris, bye.....

Luis

I recently bought one. If you can find an IBM Proprinter driver, that's fine. Also, any Canon BubbleJet driver - need not be BJ10-e. At worst, you can use any EpsonFX driver too. It's a great little printer.

> $500.00.

Wow! That's $125 each. Pretty good. But what do you want three or four
graphics cards for? Wouldn't that use up all the expansion slots?

> > An Ste with tos 1.6 and blitter performs pretty well...
>
> *IF* any software uses that blitter. very little does.

All ST software which uses the OS graphics routines will be speeded up by
the blitter. Many programs which *don't* use the OS have blitter support
as well, since ST blitters have been around since 1987.

> > Compared to an Amiga 500 the amiga only has a slight edge over the Atari..

UW emulates an adm31 terminal. Terminal features such as variable-size, etc.
are probably the main considerations. (vt-100 is fixed to 80x24 ??)

I have heard that Cold Hard Cache is supposed to be one of the better
Cache programs. Isn't it true that it is the basis for Diamond Cache?
Anyays, the docs in the version (3.5) that I have say it may not work
with partitions larger than 16M -- it says that it is untested. It
looks like maybe the author put that note in there for an earlier version
and then left it in the docs for 'history' purposes, but I am not sure.
Is anybody using CHC on >16M partitions. Can somebody suggest another
cache program?

.........thanks.........

Alright, what's the secret? This is really neat! Unfortunately it's not the most readable on my SC1224. I tried my fractint code and uniterm on it, I was pleasantly surprised to see that both work. However, I think you might want to consider giving the full 640x400 screen to TOS programs, and use the 16 line font by default. (Just like mono mode, eh?) Mebbe things like Gulam will work with the expanded screen size. (Tho, come to think of it, I doubt it. So few programs are written to be resolution independent, sigh.) At a guess, I'd say this thing must tweak the video base address during horizontal blank intervals, to skip one scan line. But how do you delay the vertical sync by one-half a scan line to draw the alternate field?

Hm... Looking on a TV, I still see black lines between pixel rows. I guess there isn't a sync delay in there, is there. Oh well. Looks kind of like one of those freeware mono emulators for color screens.

Well, I still think it's neat. I'm gonna mail a check right away for this one. Thanks.

Geeze. Can't wait to try it in monchrome. Uniterm with a 100 row screen.
I love it!

Thanks to all who replied to tell me that I need to format the
cartridge on a true mac, and then use it on Spectre. I did
that today, and everything does indeed work fine!

937. For Florent PILLET

Newsgroup: comp.sys.atari.st
Date: 1991-07-02 06:17:50 UTC
From: hohr@cernvax.cern.ch
Message-ID: <5854@cernvax.cern.ch>
Source record: 230611

I posted this mail @ Florent PILLET but it bounced. Sorry to waste bandwith, but I've no other solution. BTW Florent, do you have a "normal" Internet adress? (Like mine :-))

Hi Florent,

I suppose that french is your mother tong. If not, let me know: I'll translate the following.

Mes remerciements pour ce patch: J'avais ecris a:
HUMAN TECHNOLOGIES
54, Rue POUSSIN
75016 - PARIS
a propos de ce probleme, le 21 mai 1991: ce courrier est toujours sans reponse...

Je peux a nouveau me servir de ce logiciel duquel je suis, par ailleurs, tres satisfait. J'ai 'downloaded' (BTW, how do you say 'downloaded' in french?) un driver GDOS pour mon imprimante compatible LQ500: seule la partie graphique est imprimee, pas les caracteres, qui font pourtant partie des fontes standard ATARI. Mais cela est un autre probleme.

Je me suis permis, vu une demande de Ralph Sobek, de lui retransmettre votre message: Il a un ami qui a le meme probleme.

BTW, pourquoi ne pas mettre ce patch en PD sur un serveur europeen?

Avec mes remerciements.

Roger hohr@cernvax.cern.ch

PORTABLE ADDICTION ISSUE #02 THE Newsletter for Lynx and Portfolio Freaks

--------------------------------------------------------------------------

Editor - Tjerk "MegaJerk" Heymens Visser
Editorial Assistant - Yiri "NeuroMancer" Kohl
With special thanx to:
Andre "ALU" Luyer, Mr.Doom, Decoder, BJ Gleason (for being such
a great PFolio programmer), FunTronics Computer Shop (for being
so slow with their imports), Robert Jung (for the extra info on
fidelity chess).

--------------------------------------------------------------------------

Introduction...

Aaargh! Wotta month this has been! First of all this newsletter ascii
file corrupted. Then, after reconstructing it, we had our exams! And then
the biggest problem arose!!! Since this is the first time we've done the
newsletter on a PC, there were some problems in uploading it. We didn't
have a PC near our modem, so a friend had to do it. Our *friend* then
found out that his account on Internet had expired! But finally here it
is!
Now this issue has become a little bit lame, because of the afore men-
tioned problems. Some featured had to be left out, like an interview
with Stephen Landrum, and most of the stuff that our editor, MegaJerk,
wrote. We'll have all these features included next month. Next month
the entire Portable Addiction will have a new face, too. From then on
we'll also cover the Sega Game Gear. And in two months, our Portfolio
section will be gone. Sad, but true!
Anyway, share and enjoy! And let us know what you think of PA!
Sayonara!

Yiri "NeuroMancer" Kohl
Editorial Assistant

P.S.: I have typed this issue myself (instead of Tjerk) just to find
out which one of us makes the least number of errors, so please
let us know what you think!

--------------------------------------------------------------------------
+-------------------------------+
HOT (OUCH!) NEWS AND GOSSIP...
+-------------------------------+

PANTHER: It seems that there will be the possability of ComLynx with the
panther console. This would mean that you could connect your Lynx with a
```

panther for multi-player games! Sound like an original idea!

PORTFOLIO: The internal RAM-expansion is now officially available. Here, in Europe it costs about $250,-. This set will upgrade your D-Ram to the astonishing amount of 640K.

PORTFOLIO: Although the normal Atari modem for the Portfolio runs at the very low 1200 baud, there seems to be a 2400 baud model. We are still trying to find out more about it, so you'll hear more when we got it.

PORTFOLIO: More and more software is coming out for this little dream! There is official software for sale ranging from $50 to $270! One of these pieces of software is a replacement for the diary. We'll have full reviews next month!

LYNX: here's some news for our European readers! Atari Europe will NOT be importing the Lynx mark II into Europe this Christmas! Some people say that they will do it in the middle of next year, but I doubt that very much! Argh!

GAME GEAR: Finally released in Europe! The TV Adapter will be launched very soon, too. And since this thingy is portable, we'll be covering it from next month on in Portable Addiction!

LYNX: Prospects for the Lynx in Europe are very good at the moment. The Lynx costs only $20,- more then the GameBoy. This means that the Lynx will soon have a very solid user base in Europe, which opens up new perspectives for the European software houses! Yeah! (Hey, Bit-Map Bros! When will you be making SpeedBall II for us on the Lynx?!) Current developers known to me are US Gold, Telegames, Imagitec and Psygnosis.

PORTFOLIO: Although this little machine is megagreat (as we all know), the sales aren't going that well at the moment. Lots of people are waiting for this new Hewlett Packard thingy, which will probably released within this year. Let's just hope that 1992 will be a better year for the PortFolio.

PORTFOLIO: You can now also buy Eproms for the PortFolio. They're very cheap, and you can get them for 64K and 128K.

Just for the fun, here are the Lynx charts from both Germany and England!

Germany (or Deutschland) United Kingdom (UK)
1. Blue Lightning Road Blasters
2. Slime World PaperBoy
3. Gauntlet RoboSquash
4. ElectroCop Zarlor Mercenary
5. K L A X K L A X
6. Chip's Challenge Blue Lightning
7. Gates of Zendacon Gauntlet
8. Road Blasters Gates if Zendacon

9. Zarlor Mercenary ElectroCop
10. Xenophobe Slime World

LYNX Review
THE FIDELITY ULTIMATE CHESS CHALLENGE
From: Telegames/Atari

I Couldn't believe my eyes when I saw this. A chess game for a portable games console that only runs about 6 hours on batteries!!! But yes, of course it was true. Fidelity Chess is probably the first chess game on any portable console ever, and it's good too!

I am not going to explain the rules of chess here, for the simple reason that if you don't know how to play chess this is definitely NOT your game. As you may all know, chess games have the annoying tendency to have VERY long waiting times on higher levels. Fidelity Chess is no exception. For this reason the automatic shut-off system of the Lynx is disabled (otherwise it would just shut off while calculating the next move!).

Now on to the game itself. The gameplay itself it quite nice. All options are selected using very clear icons. The game is based on the latest most powerful chess playing technology from Fidelity, so you are assured very competitive gameplay! The controls are a bit sluggish, though. The button detection is not very accurate, so you may have to press buttons twice before the program takes note of them. This is what we call a major drawback, but even with it's control flaws it's a great game.

The presentation is very good. Icons are very clear and well drawn, and the chess pieces and board are also very good. You can toggle between a 2D and a 3D board, although the game is best played in 2D. Of course there isn't much sound, and in my opinion you don't need sound in these kind of games. For that reason I have not given any rating for the sound.

Fidelity Chess is a very good game of chess, but I doubt it very much if there's any idiot out there who wants to play chess this way. I like a game of chess, but Fidelity Chess just could not hold my interest.

+-RATINGS--+
Graphics - 8.0 : Good use of icons
Sound - -.- : I told you!..
Playability - 7.0 : Some flaws with the controls
Lastability - 7.5 : I don't think you'll play
This again AND again.
Overall - 7.0 : Great, but you'd be mad if
you'd buy it!
+--------------------Neuromancer-----------------+

LYNX Review
SHANGHAI
From: Mediagenic/Atari

Well, this too is a thinking man's game, I'm afraid! But I must say this is a very good one! Shanghai is based on Mah-Jongg. It uses the same tiles, but the rules are much different. The tiles are laid out in preset formations. The idea is to get rid of all tiles by sliding them off the board, either to the left, or to the right. You can only slide two matching tiles, so you must match pairs. You can only slide a tile if it's free, with free meaning that there's no tile on top of it, and there is an open space to either the left or the right of the tile. As you may already understand, you must think forward!

If you don't like puzzle games, you won't like Shanghai. It's as easy as that. You must know however, that Shanghai is a very time-consuming and addictive game! Before you know it you have been playing for an hour! But now let's see the other aspects of the game.

The control method is a very effective and easy-to-use one. The home computer versions of Shanghai all had mouse control, but the joypad is just as convenient! The game is very user-friendly too. Everything is done using option menu's and the like! The instructions are also build in AND you'll never have to reset your Lynx, because you can restart just as easy from a menu! Great!

The graphics are very well drawn, although I know people who have difficulties with reading the tiles. Everything is drawn in perfect detail, and the whole game looks very professional. There are nice pictures throughout the game to keep you happy, and everything is done in a nice eastern style.

The sound, too, is very good. The game has many tunes throughout, with four selectable in-game tunes and an option for sound-fx.

Conclusion; Shanghai is a MEGAGREAT game, but is only good for puzzle -freaks.

+-RATINGS--+
Graphics - 8.5 : Very effective and clear
Sound - 8.0 : Jolly tunes throughout
Playability - 9.5 : Instant appeal
Lastability - 9.0 : You'll play this a LONG time!
Overall - 9.0 : Great! You'll be hooked
forever!
+--------------------Neuromancer-----------------+

M E G A - M A G A Z I N E S

There were some people who were interested in the European computer magazines, so here follows a short description of the leading mags.

The One - now divided in two seperate magazines (Amiga & ST). This
mag is namely for games players. Includes a coverdisk.
A.C.E. - a mag for real computerfreaks. Games are reviewed here, but
there are more features, like on VR, programmers etc.etc.
C.U. - Commodore User Amiga, a cross between The One and ACE.
This mag, too, includes a coverdisk.
Video - A German magazine for consoles only. Very good with the most
Games recent games.
ZZAP! - A really pathetic C64 magazine. For $4,- you get 50 pages!!!
Raze - Formerly The Games Machine. A very good magazine for all
formats.
Mean - THE console mag. Extremely good mag, although they do not
Machines cover the Lynx.
C+VG - Or Computer & Video Games. A cheap mag in every meaning of
the word, but since they cover Lynx games, I like them.

Of course these are only the popular mags, and as you can see, there
aren't much console mags out there! It's possible to get these mags
in the US, but then you should take a subscription. This will cost you
a hell of a lot more than the usual subsciption price, since the
English add about $15 for their overseas readers (can you believe it!).
If there is anyone interested I will send them the address where to
go for the magazine.

PORTFOLIO...

Just a little note to all the readers out there. ALL the software we
test for the PortFolio is either Shareware or Public Domain, unless
we state different. Thank you!

This month we didn't have much to test on the PFolio, so this section is
rather small. I promise, however, that next month there shall be a lot
more. We'll then have an in-depth view at all commercial software
currently available for our little baby.

PORTFOLIO Review
MERLIN.COM
from: BJ Gleason

Well, we had to test something, didn't we? So here's MERLIN, once again
a game from that BJ Gleason bloke! And this time it's a real nice game,
too!

In Merlin you are presented with a nice 3 X 3 grid. Some of the blanks
in the grid will be inverted when you start the game. The idea is to
make the entire grid blank. You can do this by using the number keys.
1,3,7 and 9 will invert four boxes in the corresponding corner. 2,4,
6 and 8 will invert the corresponding 3-in-a-row along the side, and
5 will invert a cross.

Merlin is the first game on the PortFolio that keeps my interest. While
it's very simple you can just boot it up for a quick go. The sound of

the PortFolio is used quite nicely, although it must drain on your batteries! Merlin.Com is so small that you won't have any troubles with your disk space. Nice program, BJ!

PORTFOLIO...

Warning: it seems that the Portfolio Toolkit 2.0, described in an earlier issue of PA, causes programs on your RAM-disk to corrupt slightly. This makes your system crash more often!

SWAPPING SERVICE
Our swapping service has returned!

LYNX Preview
Strider II
from: US Gold/Atari

It's nice to see more and more companies supporting the Lynx. Now US Gold has joined as well. If this game will remain under the US Gold label is yet unknown, as US Gold may yet sell the game to Atari.

Strider II follows the same plot as the desk top versions. The female world leader has been kidnapped and take to a secret location. It is the usual "You're the only one who can save the day" story from here on, so you set out to rescue her. This takes you through five levels: a forest, the planet's outer defences, underground caverns, the generating station and the kidnappers' space craft.

The graphics look terrific and are a GREAT leap forward for the Lynx. In fact the whole game looks better than, say, the Amiga version! MEGA! From what we've seen it should be a very playable, if a little small, game. However, a lot can change during development of games so we hold our breath and hope for a good game. But then again, this game would be worth buying anyway, if only it was for the graphics!

T H E L Y N X S O F T W A R E T O P 1 O

This is our very own Lynx top 1O. Independant of all the other charts, We don't look at sales figures (a bad game can still be popular thanks to good marketing!). We wish to know what our readers think! So send your very own top 5 or top 1O to us, now!

```
+-----------------------------------+
S C R E E N S C E N E E U R O P E
or: How Could Nintendo fail like this
+-----------------------------------+
```

Nintendo, now a powerfull force in the world of consoles. But how did they get there? Well, the answer is simple: good marketing! They took the world by storm with their NES, and now they're doing the same with the Super Famicom. Or are they?

Here in Europe we know about the NES for a long time, but it's only One stinkin' year ago since Nintendo launched it officially here! Why? Well, they've tried to launch the thing before, but it just didn't work! Why??? Here, the answer isn't simple. Sega had just launched their Master System when Nintendo first tried to take over Europe. This was bad timing from Nintendo. They didn't stand a chance against the vast Sega-user base. That was four years ago!
Then there was an attempt about two years ago. At then, a lot of people were just turning to Amiga's and ST's. There were also a lot of smart people waiting for the Sega Megadrive/Genesis. Again, very bad timing!

One year ago, however, a miracle happened. Despite of the Megadrive and the grey imported PC Engines people were willing to buy the inferior 8-bit system! Nintendo had finally launched the NES with success, so there was no long wait till their GameBoy arrived. This little gadget then did well, too, thanks to the high price of the Lynx!

But now times are once again changing for Nintendo. The Lynx had dropped in price and is now very close in price to the GameBoy. People who want a Super Famicom will have to import the machines, since Nintendo won't launch them officially because of the fact that they have only just launched the NES. This means that a lot of Famicom fans will turn to the Megadrive, 'cos they're scared of grey import and incompatible Japanese or American cartridges!

Nintendo WILL fail again. Thank God and all the other guys who made it possible for Atari and Sega to win the Intergalactic Console Wars in Europe. 1-0 for Atari, yo! And with that I conclude this piece of bull. See you.

R E - Q U E S T I O N I N G Q U E S T I O N A I R E

We didn't get that much response to our Questionaire of last month, so here we are back again with some of the more essential questions!!! And PLEASE! Do send in your reply!

-What computers/consoles do you own, or do you wish to buy within the following six months?

	OWN	BUY
Commodore Amiga 500/1000/1500/2000/2500/3000/5000...	O	O
Atari 520st/1040st/TT/Mega STE.....	O	O

Very incredibly megagreat without any doubt..... O
Quite good in their own right, but that's it..... O
VERRRY Average, and could be a heck of a lot better. O
Darned rubbish, I usually wipe my but with them..... O
Couldn't be any worse!..... O

LYNX Review
CHIP'S CHALLENGE
From: Epyx/Atari

WHAT IS THIS! The third review of this issue and again it's a game where you have to use your brains. This game has no *real* action, but the gameplay does get very exciting, or annoying when you can't solve a level (I won't tell you what all the options are on this game, because it has been out for a year now, so I suppose that you already know). The levels keep getting harder, so you have to think more as you get to the higher levels. ARGH! There are 144 levels and they don't get boring, as the programmers have succeeded in making each level different.

I'm not really into this type of games, though. I like Shanghai and KLAX. But if you like this kind of game, you'll like Chip's Challenge (For the

real brain-freaks, there is even a Mandelbrot explorer on this card).

But I want some real mindless Arcade Action. Where is my Zarlor Mercenary card!!!

Warning! Don't play all 3 games in a row or it will fry your brains.

+-RATINGS---------------------------------------+
Graphics - 6.5 : Clear but not special
Sound - 7.0 : Many different musics
Playability - 7.0 : Easy non-complicated control
Lastability - 8.0 : It will take time before you
have figured out 144 levels
Overall - 7.1 : Good, 144 levels and doesn't
get boring, value for money
+--------------------MegaJerk------------------+

The last bit (not byte, that is)...

Well, that's it for this month. See you all next month with our all new Portable Addiction for Lynx, Portfolio AND GameGear! Yay!

HELP!

I just hooked up a Mitsumi 1.44MB drive to my ST. Now, if haven't fixed the controller yet to format 1.44MB's, but that isn't the problem.

It seems that my ST thinks both Drive A and B exist even though I only have one drive! What ever do I do to fix this? Also, I've gotten bombs when trying to delete stuff on a write protected disk. I think something is afoot!

The drive works otherwise. Please help me.

Dom

P.S. Has anybody seen or heard of a program that'll let you selectively turn on or off Drive B? i.e. you forgot to turn on Drive B and powerup, so you need to let the ST know it exists, or you are having problems with Drive B so you want the ST to think it isn't there.

> Brett.

Well in the UK, they are selling real Atari replacment drive, 49 pounds.

Note: did you have a small pcb connected to the back of the SS drive ?
this must be removed, also some of the early PC drives have a 6 ms
step rate, don't use these, also I don't recommend the use of 1.44 meg
drives, if your are only using it as a 800k drive,
Heads are smaller, causing greater disk failures,
These drives can be a bit of a problems in getting the
drive to work due to strapping options not being set correctly.

945. Electrohome ECM1311 and ST

Newsgroup: comp.sys.atari.st
Date: 1991-07-02 14:07:21 UTC
From: monck@ibmpcug.co.uk
Message-ID: <1991Jul2.140721.25253@ibmpcug.co.uk>
Source record: 230628
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,connect.audit

Hi,

I have seen (in the UK) the Electrohome ECM11311 multisync monitor for sale
at a price of 149UKP.

Can anyone tell me anything about this monitor, and especially if it will
work in all three ST graphics modes.

I'm also thinking of getting an NEC 3D but this Electrohome monitor offer is
much cheaper, so I'd like to go for it if someone can tell me it will
work.

Thanks,
Paul

946. High Rez Cards?

Newsgroup: comp.sys.atari.st
Date: 1991-07-02 14:47:03 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <CMM.0.90.2.678466023.dhbutler@magnus.acs.ohio-state.edu>
Source record: 230619

This is my first time up on this system, so I hope this gets through fine (without multiple copies etc., such as I often see). I am a proud general partner in the company High Resolution Desktop Publishing, in Columbus Ohio. I run the company (I'm the creative end, and my partner is the business end) off a Mega4 with ADSPEED (which is great), the GCR (which is also great), and Calamus/outline art. The Mad Axeman Press is another Atari based (using Pagestream) Desktop publishing company here is Columbus! So, the Atari is actually being used for professional applications! (kinda nice huh?)
My main question is: What type of color cards can I get for the ST. I know very little about this area despite doing lots of research. Even RIO DATEL does not know any of the Tech. specs for the cards that they will supposedly have by the end of the summer. I am looking for a (voice) phone # that I could call, and an address I could write to in order to get some info on these devices. I don't mind ordering through CANADA if I have to, or even further if I know the product will be compatible with U.S. scan rates. I have an 800*600 multisynch (get the swithc from IB Computers, it is nicer by far than the one from TALON), and I would like a Calamus compatible color card for the full 16million colors (256 on screen is acceptable of course, but more would be nice). I would prefer one that would work with my monitor, but would consider switching if necessary. ANY INFO AT ALL WOULD BE APPRECIATED.

My second question is: Overscan, I have it installed, but the incompatibilities are numerous. I have heard of a product called AUTOSWITCH OVERSCAN, which I would like to get. Seeing as networking is not my boat, I would like an address or tele# to call to get this product.

And third: Get a life you guys who argue continously about which computer is best, hell, I like all of them, they are all great for different things, and all the main systems (amiga, atari, mac, ibm) are pretty much competent all around systems. If the human race can't even stop bickering over which computer to use (yea, you are arguing over a hunk of silicone and a few wires), how the hell can we agree on anything that actually matters at all!

948. J, version 3.2, for the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1991-07-02 16:25:04 UTC
From: ljdickey@watserv1.waterloo.edu
Message-ID: <1991Jul2.162504.17970@watserv1.waterloo.edu>
Source record: 230631

```
J, version 3.2,
and other APL Software
at Waterloo

Version 3.2 of J, is now available on the file server

watserv1.UWaterloo.CA [ 129.97.129.140 ]
watserv1.Waterloo.edu [ 129.97.129.140 ]

at the University of Waterloo. In the directory "languages/apl/j",
anonymous ftp users may find J for these systems:

3b1
mips
next
pc
sgi (irix)
st (atari_st)
sun3
sun4 (sparc)
vax (vax_bsd, ultrix)

Earlier releases of J are available for certain other systems:

sun386i
mac

An index showing all APL files is available as "languages/apl/index".

Other dialects of APL, such as Sharp APL, I-APL, and "ratapl" are available.

Three APL fonts may be obtained.

(1) APL2745, a postscript line font
(2) An X-Windows font
(3) A TeX font.

Currently, this service is being provided on an experimental basis, and
there are no promises that it will continue on a long term basis, nor
is there any warantee of serviceability or completeness of the software
distributed from watserv1.

It is hoped that eventually there will be a mail server for the same
range of software to those who have e-mail access but no ftp access,
but a userid for this mail service has not been announced yet. In
the meantime, BITNET users who do not have ftp may
find the service "BITFTP at PUCC" helpfull. For example
this mail message (with no leading blanks)
```

To: bitftp@pucc.bitnet

FTP watserv1.waterloo.edu UUENCODE
USER anonymous
CD languages/apl
BINARY
GET index
QUIT

was successful in acquiring the index. Similar messages could result
in receiving the various pieces of software.

Once you have the index, you may see the name of some other file you
want. For such a file, determine the directory path (``dp'') and
the file name (``fn''). One example you will have already done:
the file "languages/apl/index" splits up as:

dp languages/apl
fn index

As another example, if you want the file "languages/apl/j/pc/j_pc_32.arc",
you would use the directory path and the file name:

dp languages/apl/j/pc
fn j_pc_32.arc

Prepare a little file to be a mail message to pucc:
(As before, no lines of the file have no leading blanks.)

To: bitftp@pucc.bitnet

FTP watserv1.waterloo.edu UUENCODE
USER anonymous
CD dp
BINARY
GET fn
QUIT

Of course, in the above, you replace "dp" by the appropriate directory
path, and you replace "fn" by the file name. Use your local e-mail to
send the file off. If all goes as intended, when PUCC gets your mail
message, it does the "ftp" session for you, using the commands you have
supplied. It wraps the file up in a "uuencode" package, and mails it
to you. When you get the file, you may have to combine several files
together, remove superflous blank and mail header lines, and uudecode
the file.

>>I cant say how good itll [sic] do over 200, but I suspect our VMS license
>>is only 256, so the point is moot.

Well, come on, who cares about the number of users. You must certainly be using 5 or more processes yourself if you're really taking advantage of a [yech!] VMS system. Before I came to C=, I programmed on one of these babies for four months at GE (my shortest job ever, 'cept for summer jobs). You obviously SPAWN off anything that takes more than 10 minutes to compile. You run Emacs as a separate process, etc. The VMS license, if anything like a typical UNIX license, only limits logins, not processes. So if you really think you don't need multitasking, you're either doing something really strange on that system, or you don't know how to use it effectively. It's certainly much harder on a VAX or anything else without a GUI. That doesn't make me wonder about multitasking systems without GUIs, but it sure made me wonder about GUIs without multitasking, ever since I first saw a Mac...

>Anyways, compared to this, the Atari _and_ the Amiga is a toy, OK? VMS is a
>real multitasking system, fact.

So is AmigaOS. VAXen, like it or not, are getting mighty slow and mighty expensive by modern standards. That's why "cbmvax" here is a DECstation 5000, based on the MIPS R3000, not a VAX anymore. VMS, like UNIX, is a real multiUSER OS, while AmigaOS isn't. And it does have some elegance here and there, but for the most part it's butt ugly, IMHO. Referring to "Rico's Molly Benchmark Chart" here, I find the VAX 6320 under VMS doing 4.5 mollies, with the A3000 doing 7.3 under UNIX. Now who's the "toy"? (Answer: the MicroVAX, which does 1 molly, compared to the PC-AT at 1.1).

953. Unix Windows Explanations

Newsgroup: comp.sys.atari.st
Date: 1991-07-02 18:09:08 UTC
From: JJL101@psuvm.psu.edu
Message-ID: <91183.140908JJL101@psuvm.psu.edu>
Source record: 230632

It has been brought to my attention that a more thourough explanation
of the previous post on Unix Windows should be given. This week I decided
to give UW a shot, and when I booted it up and read what docs there were, it
seemed that this could be a VERY handy little program. Allowing my to connect
to a couple of different Unix boxes, and even a 3090 mainframe all at one
over a 2400 baud modem without much reduction in speed. (Quick screen updates
and the like).
I compile UW on the unix side without a hitch or any modifications (which
I must say shocked me :) and then switched emulation mode to adm31 on the
unix side. UW ran fine as long as I stayed on unix machines. When I tried
to go to a ibm 3090 vm system from the unix box via tn3270 , I encountered
problems. In the map3270 file it lists a adm31 entry with pf key control
codes, however the keybad does not send these codes out (at least I could
not get them to). I then started putting these pf and other control code
keys into the definable function keys on the st side of uw, and then tn3270
worked fine. However I would much prefer to have the keypad react in a pfkey
style, and which is why I was wondering about vt100 in uw. But since vt100

seems to be impossible to get in UW, I am now looking for a way to get the
keypad into a non-numeric mode. Is this possible? Has anyone taken a look
at the source to this program? Does it appear difficult to add a vt100
mode to the terminal?

hope this clears up some of the questions about my questions :)

>in YOUR newsgroup, not ours.
>
>Which is too bad, because most Amiga users I've met have been good
>folks. Well, you started it. You can have it back.

We don't want it. WE didn't start it. Some person who _happens_ to own
an Amiga started it. It is of no concern to most (if not all) of us, and
we'd rather you deal with your newsgroup problems in your own newsgroup.

Obviously nothing good can come out of this flame war, and it would just
be an annoyance to us. Since we were uninvolved at the start, I don't
see why you should involve us now. Please learn to ignore people who
flame just for the sake of flaming.

Perhaps you should create a comp.sys.atari.st.advocacy. Our .advocacy
group has become quite a place for debate, and flame wars are not so
frequent anymore. In fact, there is sort of a side-discussion about
how advanced the DOS routines in TOS are compared to AmigaDOS'
dos.library. You are welcome to come over join in. Please don't
bother flaming, though. We're looking for real discussion, not trash.

Just trying to keep the peace in c.s.amiga.*,

955. Help with altboot4.0e

Newsgroup: comp.sys.atari.st
Date: 1991-07-02 20:15:18 UTC
From: Bryan_Jones_Woodworth@cup.portal.com
Message-ID: <43907@cup.portal.com>
Source record: 230643
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I need HELP with Altboot 4.0e.

If you know what this program is (it lets you boot alternate configurations when you hold down ALTERNATE) then please attempt to assist me.

When executing my configuration files, all works well until I try to add a modifier for another type of file. Ex: To load a different desktop.inf, you enter a single-digit, such as "0" or "1" followed by return. ALTBT will then rename DESKTOP.IN0 to DESKTOP.INF and the previous DESKTOP.INF will have been renamed to what it was previously (DESKTOP.IN1 or some other).

I cannot get it to do this with a list of data (FILE.LST). This data file tells my Ramdisk copier what files to copy to Ramdisk upon bootup. I maintain many lists of FILE.LST (so they will give me flexibility with this programme). One will go with a 52K configured RAMdisk and copy UUD/UUE to RAM. another FILE.LST copies GIF viewers to RAM.

Here is an example of a configuration file which works.

```
hd_reset.prg enable hdreset
hdstrt10.prg Pick progs from a menu
codekeys.prg Install codekeys
lgselect.prx Don't want a file selector now
1 desktop.in1 = current desktop.inf
codekeys.acc Make codekeys work too
```

Now, according to the documentation, I should enter a "#" on an empty line; then the files with their path in order to rename 'em. So, I add:

```
#
a \ file.lst 1 file.ls1 will be current file.lst
```

However -- With these two additional lines, Alt-Boot ignores my configuration file completely. EXCEPT for the fact that it *does* say, "FILE.LS1 current FILE.LST" That is, it does *not* modify my programs/accs as specified in the beginning of the configuration file.

HELP!!!!

Any comments?
(I tried sending mail to author via Internet but frigger mail bounced)

I'll try. :-) I tried this program many moons ago also. It does NOT work on a color system. I didn't try using it with any of the mono emulators so perhaps that would be your first move. If you have Mac emulation, you can try running Maclayers under the Mac OS. It works better than uw anyway. You can get it through anonymous FTP from Rascal.utexas.edu.

Good luck.

>The Macintosh will do 4. Each of those 8-bit, 44KHz sampled.
~~~~~~
Since when. This implies that a Mac is capable of CD quality sound if you
use two eight bit ports as one output. NOT a chance in hell. The Mac
in its standard configuration is limited to 8 bit sound with a max
sampling rate of 22Khz.

BTW - My NeXT can handle 4 channels of CD quaility sound, that is 4
channels at 44.1k and 16bits directly from the harddisk. Two channels
will be multiplexed on one speaker.
Anyway, the only thing inferior to a Mac in the standard sound catagory is
an IBM PC.

Just thought I'd let everyone know that I will be on vacation for the rest of the week, so I've posted this week's program to atari.archive.umich.edu.

DC Homey will home the mouse cursor to the center of the screen. Just press <ALTERNATE>+<CONTROL>+<LEFT SHIFT>+<H> at any time.

>there, but for the most part it's butt ugly, IMHO. Referring to "Rico's Molly
>Benchmark Chart" here, I find the VAX 6320 under VMS doing 4.5 mollies, with
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
>the A3000 doing 7.3 under UNIX. Now who's the "toy"? (Answer: the MicroVAX,
^^^^^^^^^^^^^^^^^^^^^^^^^
>which does 1 molly, compared to the PC-AT at 1.1).

I thought we were talking about VMS.... Now, if you put UNIX on that VAX
6320, then it would run circles around that A3000 running its flavor of
*nix. Hardware-wise, the A3000 could hardly run VMS. Just because VMS
is a "dog", one does not need to condem the hardware. VMS is slow.
UNIX is fast. They originated and were designed around different OS
concepts. They can't be compared. But, you seem to fall into the
falicy of Multitasking... Yes, actually, VMS does multitask, just in a
different way than most other OS's... All multitasking on the above
mentioned machines is more like "time-sharing". It is not until you have
MULTIPLE processors, running concurrently that you would get true
multitasking...

Sounds like Atari in the USA is in about the same state as it is in Australia.
The thing is that Atari is not making the public aware the type of machine
the Atari is or what type of work it can do. A recent advertisement in
Australia shows a teenager in his room playing Captain Blood on the Atari ST.
I wonder why the Atari is still tought as a games machine here.
What did Atari in Germany do to get such a good reputation there?

Yes, I can suggest Atari's CACHEnnn program. It works with AHDI
3.01 and large partitions. I don't know how it compares with other
programs, but it certainly does the job of speeding your disk reads.
You can get this as 'utilities/rainbow.arc' from atari.archive.

Source record: 230672

B> > Of course the amiga does multitask but I have very little use for
B> multitasking..
B>
B> That's what many people say, until they try Amiga multitasking.
I have seen people use the multi tasking.. The main reason for multi tasking is
that on the amiga many programs just have general functions due to the fact
that many other programs can do these functions well. On the ST MOST of the
programs that are out now (Games don't count since most dont multi task even
on the amiga.. I am talking games like falcon etc.. Some you CAN multi task
but you really do not wanna do so unless your running a fast machine)
Anyhow, MOST of the ST programs out now have many ways of getting some of the
important features done in a "multi tasking" environment. On the amiga multi
tasking is very useful for the current software do to generalizatins.. On the
ST this is not the case necissarily.. Multi tasking is of SOME use but not
really that BIG a thing at the moment.. Desk accessories and TSR's running in
the back ground normally pick up the slack on the ST where you would do them
with multi tasking on an amiga. (However I can do SOME multi tasking on the ST
with the power of the amiga's multi tasking with third party software...
But why? It already can do all I need for it to do I do admit though that on
SOME vague occasions I would have appreciated multi tasking..)
Note, I have an 8meg IBM I run my 2 bbs lines off.. Desqview is a necessity in
this environment. Multi tasking is great for this purpose...
B>
B> > As to sound? Well The ST is the only one so far that has the capability
B> of 3d
B> > sound. The STe series computers have the capability of using 3 seperate
B> > speakers with different sounds out of each.... 2 of those full 8 bit
B> digital..
B>
B> How many bits is the other channel?
The STe's stereo ports are each one voice of 8bit DMA sound...
The monitor port (Which can be tied into the two stereo channels or left
seperated from both. If combined then the stereo outputs also output to the
monitor...)
The third port has 3 voices of synthisizer quality (The normal ST's sound)
When not in Digital mode these 3 voices are DMA type sounds.. It taxes the
CPU when doing Digital sound. Digital sound is done much like the C-64.. All
three channels are combined and you only get a 4.5bit sample out of it..
Realize that if left seperated from the stereo ports you have three DIFFERENT
speakers with three different sounds comming out of them..
If you tie a tweety board onto the ST sound chip in the STe you could actually
seperate the 3 channels of ST non-digital sound into three seperate channels..
That would give you a total of 6 speakers all of which would have different
sounds comming from them...

2 Digital Channels (Stereo)
3 Seperate Sythisizer channels (NO digital stuff here.. Would sound like noise!)
1 combined channel of the above three channels. (You really couldnt do any digital stuff though cause the 3 seperated channels would sound very bad. B>
B> So you're saying the ST can use all 16 Megs for graphics? I admit I
B> wasn't
B> aware of that. I thought it used a screen buffer.
No screen buffer... An area is setaside for the screen but this is setup depending on the size of the screen. The STe's have very good scrolling capabilities. VERY fast.. The standard "limitation" is 4 meg...
I am not sure but over 4 meg you might run into problems.. The TT has 4 meg of "Chip memory" available (if all is added) unlike the amigas 512-1meg (or 2meg in the 3000) The rest would be "fast ram"
Waste memory? Anytime you have to load information into memory in two places would be considered to me to be a waste of memory.. With complicated animations on the amiga your limited to either 512k or forget about running on half the machines out there.. Anythign above this would have to be fed down from fast ram.. The st-ste-tt Is plug and go.. No need to feed anything down..

I'm a big fan of Double-Click Software. Every time I go to GEnie's Atari ST File Exchange section, I always look for Double-Click contributions right away; works from DC Desktop all the way down to F-Light are permanent installations on my system. But it appears that these programs are getting increasingly useless as time goes on. I mean, you've got to be kidding me; you're going to replace a slight wrist motion with a four-key combination? Why???

I don't mean this as an insult, but I get the impression that the committment to one new program per week is resulting in rushed jobs and a low tank of ideas. Guys, you're the greatest, and we won't be insulted if you want to cut back to one program per 2 or 3 weeks, so as to spend more time on each.

><ALTERNATE>+<CONTROL>+<LEFT SHIFT>+<H> at any time.

Isn't this getting just a little bit silly? I think the `one program per
week' thing is a bit out-of-hand.

1. AltCntlShiftH is more complicated than moving the mouse.
2. Why would you WANT to do it anyway?
3. IF Homey intercepts traps (it probably doesn't though), then
it is another slow-down.

Please, I AM NOT MEANING TO DISCOURAGE, I just wanted to give my opinion.

Small, useful programs are excellent. But really, they HAVE to be useful.

Warwick.

> thinking of porting it to color? Would be appreciated by a few people
> I am sure....

It's been done. I played around with a color Unix Windows a year or so ago. I didn't find it very useful because the resolution of the color monitor is not quite good enough for comfortable viewing of the small fonts that are necessary to display full-size screens inside GEM windows.

People with color systems might find a more workable solution in a program called Screens that runs on the Unix host. You can use any VT100 term program (I used Uniterm) and flip among virtual terminals with a hot key.

I can't tell you where to find these items. It's been awhile since I had access to a Unix site, so I don't need them myself.

Steve Yelvington <steve@thelake.mn.org>
If mail fails, try steve%thelake@cs.umn.edu ... the Minnesota domain MX site jhereg.osa.com apparently has been having difficulties.

It seems like systems will eventually be built from one chip; maybe one day, debating about which one is superior will be as commonplace as arguments over the better phone or refrigerator. Apple's redirection toward OS production seems to indicate that growth and profits are found in the software domain, but I'm not sure which companies will be dominant in the software/hardware arena.

>...
>Even if you where to argue that the current architecture targets a
>specific HOME market, it STILL costs too much!
>

Since CD-I systems will probably become a popular fixture in home, school and business, it would be nice if Atari could become a development platform for them. As a peripheral, CD-I seems to cover both the audio/video niche markets. For audio, AM-quality sound or voice-quality play up to 18 hours. Impressive video capabilites that include Photo CD display (16 million colors), dynamic picture effects like dissolves, wipes, etc., full-screen full motion video with a MPEG card. In one system version, expansion ports will allow Ethernet, SCSI, memory boards, parallel port, multiple serial ports, etc. [This info is from a brochure and I'll post complete specs if there is interest].

>Atari missed the boat, they should have made an entirely NEW modular
>machine. Soon as I get the money, my MEGA STE is going to sit and
>either run MAC software or my BBS software.
>

Jim Miller, V.P. of R&D, said that a new series with expansion slots was under development, so they'll have the product, but will they have the price?

Jack

Why not do things the way BIGSCREEN does and use normal ST hardware scrolling
at a character height resolution. Then your program would benefit everyone.
OK we can lose the interlace version for old ST's.

980. NEED SM125 line transformer! URGENT!

Newsgroup: comp.sys.atari.st
Date: 1991-07-03 08:21:29 UTC
From: juel@hpbbm.HP.COM
Message-ID: <410002@hpbbm.HP.COM>
Source record: 230587

A while ago i purchased an SM125 b/w monitor for only 150DM (about 85$, it was determined for use in UK), but w/o any warranty. As i connected it to my good old 1040, i realized that the missing warranty for this thing had a reason:

Nothing appeared on the screeeeeeeeEEEEEEEEEN :-(:-(:-(

After examining the monitor, i found the line transformer (i hope this is the right word; i mean the high voltage transf. for the CRT) defect. I contacted a few adresses i knew here in Germany and tried to get this essential part but had no success. :-(again

Now my question/request/entreaty/prayer/supplication to you:

- Does anybody know where i can get this transformer? It's really urgent!!!
- What does this thing cost???
- Can anybody provide adresses of MAIL orders which sell this thing???
- Could anybody possibly be so kind and purchase this thing and send it to me to Germany????

PLEASE HELP ME!!!!!!!!!!!!!!!!!!!!

Thanx
Juergen

981. Re: GCC 1.39 -g Problems

Newsgroup: comp.sys.atari.st
Date: 1991-07-03 12:14:39 UTC
From: gjh@hplb.hpl.hp.com
Message-ID: <GJH.91Jul3131439@ghiggins.hpl.hp.com>
Source record: 230664

```
++ I have got "gcc139b.lzh" containing the GNU assembler for ATARI-ST
++ version 1.38 from Uni Koeln and the GNU debugger "gdb" from A.A.

I would advise against such "mix-n-match" setups. That's why I have been trying
to create a "standard" ST GNU release on A.A.

Here's an extract from A.A.'s ~ftp/atari/gnustuff/tos/gdb/gdbsrc00.zoo README
file ....

++ Here is a heavily hacked gdb for atariST, based on the incredible work
++ of John Dunning of porting it to the ST.
++
++ The big difference is that this version supports dbx_format symbols and
++ stabs, not the gnu format (ie: "gcc -g" and not "gcc -gg"). gnu has
++ essentially dropped support for the -gg format. Other than that, it is
++ still undergoing development, to make it as stable, and to bring it up
++ to the changes in the latest rev of gdb from FSF. It is quite usable,
++ and a lot of you have been waiting for "something" so i am sending it
++ out for you to play with. I will provide updates (hopefully in a timely
++ fashion :-).

Claro?

>Was version 3 of STalker/STeno ever released? Anybody know of a mail-order
>house where I can get it? This version was to support z-modem background
>and scripts. Thanks....

Last I heard Gribnif Software had gotten ahold of the distribution rights and had turned STalker and STeno into separate packages, and is charging (I think) $15 to upgrade each to V3.0. Of course, I bought the two as a single package for about 18 bucks, and if Gribnif thinks I'm gonna shell out 30 bucks to upgrade, they are out of their minds... especially when there are far better telecom packages available PD.

I've heard Gribnif usually has outrageous upgrade fees... one of the reasons I steer clear of their products.

Speaking of telecom software, has anyone tried out Stealth? They really toot their own horns in the ads, but I haven't heard any real feedback on the program. I'd need a pretty convincing argument to change from Uniterm (for VT100 emulation) and Dterm (for general bbs usage). Flash is a good tool for beginners, but I didn't find STalker useful at all.

Message-ID: <9107031414.AA26256@exurchn1.ericsson.se>
Source record: 230659

Hello everyone,

My name is Chinh. I am new to USENET as well as to the atari computer system. My friend brought me an atari st four years ago. Since then, I used it for maximum of 50 times. Now that I have free time, I want to learn more about this computer that my friend brought for me. I have quite a few questions to ask, but before I go crazy with them, I will ask only the essential ones.

1. I live in Dallas. Where can I get any help for my computer?
2. I have hard disk, color monitor, and an ST. What can I do with them (besides selling them)?
3. I heard so much good things about it. How can I use as it as a terminal to call into the IBM mainframe? In other words, what emualtion package should I purchase?
4. I would like to do some word processing (publishing) with my atari. What publishing programs are there available? What laser printer is best suited for the atari?
5. I read some of your notes about monitors. What is a good one (reasonablely priced) for publishing program?
6. Is the ST good, or should I dumped it for something new?
7. My friend wants to put up a BBS board. I don't want to buy PC for it, so can I use the atari instead? And where would I get such information about it? And is it hard to maintain, given that I am a novice at it?

Besides those questions, I asked you persuade me that this gift my friend gave me is worthwhile - not just gag sitting on my desk collecting dusts.

PLEASE HELP..... Chinh.

985. Hardware Upgrading Questions

Newsgroup: comp.sys.atari.st
Date: 1991-07-03 14:14:32 UTC
From: ameij@vax.oxford.ac.uk
Message-ID: <1991Jul3.151434.927@vax.oxford.ac.uk>
Source record: 230677

Dear Chums,

Three questions about hardware...

1) I want to fit a hard disk to my Mega 2 ST. Has anyone any experience of internal ones? I think the box is dead neat, and would prefer not to add another.

2) Does anyone know the status of the putative Atari-UK DMA port transputer add on box? There were strong rumours about it around 8 months ago, but since I have heard nothing.

3) I may want lots more numerical bang. Would I be better to buy a TT (I imagine I would need the maths coprocessor, if that's an option) or an ATW? Can anyone let me know how much an ATW is in Britain these days?

Jan Ameij
ameij @ uk.ac.oxford.vax

PS _Particularly_ re question 3 - Please please please don't tell me I need an IBM/Amiga/Mac something instead. I shall consider all the options. I am here to request info on Atari products...

986. Re: Unix Windows, Where?

Newsgroup: comp.sys.atari.st
Date: 1991-07-03 15:35:28 UTC

987. MultiGEM, survey of responses

Newsgroup: comp.sys.atari.st
Date: 1991-07-03 17:58:39 UTC
From: seldin@alcor.concordia.ca
Message-ID: <639@daily-planet.concordia.ca>
Source record: 230665

I have to apologize to everybody for taking so long to send this
summary of the replies I received about MultiGEM. All the
replies arrived during a two-day period. At first, I was waiting
for more replies. Then, I was caught in a rush to meet a
deadline. This is the cause of the delay.

Here are the replies:

seimet@rhrk.uni-kl.de wrote:

I use MultiGEM since April and it seems to be pretty good. Unfortunately
the ST-version (TT-version will be available soon) does not support the
new desktop, i.e. you can't start programs by the function keys.

>1. How good is it? Will it run, for example, dvist and unix
>windows? Will it permit a background kermit transfer via unix
>windows or uniterm?

I have never tried but I don't think MultiGEM supports a background data
transfer. You can run up to 6 applications (including accessories!) at the
same time but this is no real multitasking. The programs in the background
only get cpu time when the main application calls GEM using an evnt-call. So
if this application is no GEM application or rarely makes AES calls the
background programs won't get cpu time.

>3. Does it run on a TT? If not, is there a version for the TT?

MultiGEM runs on a TT, but as mentioned above at the moment it doesn't
support the TT or MegaSTE desktop. The author recommends to run MultiGEM
only in ST ram but that's not necessary.
In my opinion there is no reason to sell two versions, one for the ST and
one for the TT. Nevertheless there are plans to sell a special TT version for
a higher price. If the problems with the new desktop are fixed (they have to
be because these bugs are the same for TT and MegaSTE) MultiGEM should run
on all machines.

Hope you got some new information from this. Bye

```

avgroeni@praxis.cs.ruu.nl wrote:

As far as I know (haven't seen it, but someone I know has) MultiGEM is just
like GEM, but the AES shel_ primitives now support not only parallelism between
one application and multiple accessories, but also to more than one allpication,
where each application has a window of itself, containing the menu bar and sub-windows.
(this is exactly the ways MSWindows works.) The GEM primitived are written in such a
way that it does NOT matter whether the system allows multitasking. That is, an application
that is written on a single tasker doesn't notice any difference, provided it's resolution
dependent, etc.

rjast1@unix.cis.pitt.edu wrote:

Ok, here's what I know about Multi-GEM, in talking to the company releasing
it in the U.S:

It comes from Germany (American company is translating it), is supposed to
be able to multitalk GEM programs, not just TOS/TTP (every program multitasked
works inside a GEM window). It uses the ST's ACC ports - so at least 6
programs can be running (dunno if DC Stuffer or similar programs can
do more). Since it uses the ACC ports, it's supposed to allow you to
run ACC's just like a PRG - just double click on it. It splits memory up
such that the main program you have up gets priority, and others next
priority.

It looks promising - they didn't say about what it can't do however
so that'll take trial and error. The company mentioned $99 price,
though I've heard some places saying about $69 or so.

Anyways, could you send me the address/phone number of the place
you saw it advertised? Thanks...

Robert Anisko

988. Gnu-emacs under MiNT

Newsgroup: comp.sys.atari.st
Date: 1991-07-03 18:56:54 UTC
From: peter@geog.ubc.ca
Message-ID: <1991Jul3.115654@geog.ubc.ca>
Source record: 230667

Hello,
A while ago I asked whether anyone has been able to compile gnu-emacs
using the MiNT libraries to allow multitasking / multiple shells etc.
while running under MiNT. Since then several others have expressed
strong interest, but there hasn't been any really concrete information
passed along to me. (No one who replied had actually done it)
About the most useful information came from a
post here some time ago (which I saved). I haven't been able to
contact the author of this post however -- maybe someone else could try.
Anyway here it is:

>From: erlingh@idt.unit.no (Erling Henanger)
>Newsgroups: comp.sys.atari.st
>Subject: Re: MiNT/MGR questions
>Message-ID: <1991May5.191701.26757@ugle.unit.no>

(NTH)

> ------ / \ /____ / / |/ ____| o Atari Lives !

I guess before I try it, I'd like to know which #ifdef's need to be
removed. However, I will try this out (eventually). In the meantime,
if somone else has more information, or has tried it themselves, could
they either post here or email me the information and I will summarize,
as there seems to be quite alot of interest.

The following was recently posted to the comp.sys.amiga.emulations newsgroup (don't worry, no flame war stuff! :-) and may be help:

---------->8 cut here 8<----------

From uhccux!munnari.oz.au!uunet!mcsun!hp4nl!star.cs.vu.nl!sreiz Wed Jul 3 10:15:04 HST 1991

Minix is a version of un*x that has been ported to several common
computers; the (IBM-compatible) PC, the Atari ST, the Apple Mac,
and the Commodore Amiga. It is not an emulation but a complete
OS, an alternative to the AmigaOS. It is a commercial product,
published by Prentice Hall, the US price is (I think) $169.
It runs on all amiga models including the a3000, and supports all
Commodore hard disk controllers. The demo version of Amiga Minix
can be found on ftp.cs.vu.nl [130.37.24.6], in /pub/sreiz/minix.

Regards,

Steven Reiz

The standard minix info sheet follows below.

1. WHAT IS MINIX 1.5
MINIX 1.5 is a new version of an operating system that is very similar to
UNIX. MINIX has been written from scratch, and therefore does not contain any
AT&T code--not in the kernel, the compiler, the utilities, or the libraries.
For this reason it can be made available with the complete source code
(on diskette). It runs on the IBM PC, XT, AT, PS/2, 386, and most clones.
Versions are also available for the Atari ST, Macintosh, and Amiga.

This version (1.5) is a major improvement over all previous releases, with many new features, fewer bugs (hopefully), much better performance, and proper documentation. The old versions have been in widespread use all over the world for 3 years. There are probably tens of thousands of users.

2. MINIX 1.5 FEATURES (IBM, Macintosh, Atari, and Amiga versions)
- System call compatible with V7 of the UNIX operating system
- Full multiprogramming (multiple programs can run at once)
- Kernighan and Ritchie compatible C compiler
- Shell that is functionally identical to the Bourne shell
- Five editors (emacs subset, vi clone, ex, ed, and simple screen editor)
- Over 175 utilities (cat, cp, ed, grep, kermit, ls, make, sort, etc.)
- Over 200 library procedures (atoi, fork, malloc, read, stdio, etc.)
- Spelling checker with 40,000 word English dictionary
- Full source code (in C) supplied on diskettes (OS, utilities, libraries)
- Easy-to-read manual telling all about MINIX and how to install and use it

3. ADDITIONAL FEATURES
In addition to the above features, there are other features present in some (but not all) versions of MINIX 1.5. Some of these are listed below.

3.1 ADDITIONAL MINIX 1.5 FEATURES (IBM VERSION):
- Runs in protected mode on 286 and 386
- Support for extended memory up to 16M on 286 and 386
- Up to 3 simultaneous users on one machine
- RS-232 serial line support with terminal emulation, kermit, zmodem, etc.
- Distributed computing on Ethernet (remote login, etc.)

3.2 ADDITIONAL MINIX 1.5 FEATURES (MACINTOSH VERSION):
- Up to 3 simultaneous users on one machine
- RS-232 serial line support with terminal emulation, kermit, zmodem, etc.
- Runs under Multifinder
- Includes support for multiple user windows

3.3 ADDITIONAL MINIX 1.5 FEATURES (ATARI ST VERSION)
- Up to 2 simultaneous users on one machine
- RS-232 serial line support with terminal emulation, kermit, zmodem, etc.
- Support for various real time clocks (Mega, BMS, ICD, Supra, Weide)

4. HARDWARE REQUIRED
- IBM: PC, XT, AT, PS/2, or 386 that is 100% hardware compatible with the IBM line. A hard disk not technically required, but is strongly recommended to take full advantage of the system. At least 512K of RAM is required, as well as a CGA, EGA, monochrome, or Hercules video card, or another card that emulates one of these. Both 5.25" and 3.5" diskettes are supported, as are printers using the parallel port and modems and terminals using the serial port.

- Macintosh: Apple Macintosh Plus, SE, SE/30, II, IIcx, or IIx with at least 1M of RAM. An additional 1M of RAM and a hard disk is strongly recommended. MINIX has been tested primarily with version 6.0 and latter of the Apple system software.

Problems may conceivably arise with earlier versions. Any
hard disk or display that is supported by the normal Macintosh
OS is also supported by MINIX.

- Atari: Atari ST or Mega ST with at least 1M of RAM. Although the
system will boot with only 512K, you will be very restricted
in what you can do. A 720K diskette drive is required to
install the software. The older 360K diskette drives are
supported, but are not capable of reading the (720K)
distribution disks. A hard disk is supported, but is optional.
Some of the Supra hard disks are not Atari compatible, which
can cause problems. A fix is available from the MINIX Centre.

- Amiga: Commodore Amiga 500, 100, 2000 or 3000 with at least 1M of RAM.
One 720K diskette drive is sufficient. Hard disks connected to
a Commodore Hard disk controller (A2090 SCSI, A2091, A590,
A3000 hd controller) are supported. All processors (68000,
68010, 68020, 68030) are supported. A MMU is not required.

5. PARTIAL LIST OF UTILITIES INCLUDED IN MINIX 1.5

Chap. 11 NETWORKING
App. A MINIX SOURCE CODE LISTING
App. B CROSS REFERENCE MAP

8. MINIX BOOK
The author of MINIX, Andrew S. Tanenbaum, has written a book describing how operating systems in general and MINIX in particular work internally. The book describes an earlier version (and includes a source listing), but it is still useful for understanding how MINIX works inside, even if some details are now different. The bibliographic information is:

Title: Operating Systems: Design and Implementation
Author: Andrew S. Tanenbaum
Publisher: Prentice-Hall
ISBN: 0-13-637406-9

Paperback versions are also available in English (outside North America only), French, Spanish, Italian, and Japanese. The books can be ordered from any bookstore.

9. HOW TO ORDER MINIX 1.5
MINIX 1.5 is being sold by Prentice-Hall. The product numbers and prices are as follows:

- MINIX 1.5 for the IBM: 5 1/4" (0-13-585076-2) $169
- MINIX 1.5 for the IBM: 3 1/2" (0-13-585068-1) $169
- MINIX 1.5 for the Amiga (0-13-585043-6) $169
- MINIX 1.5 for the Atari (0-13-585035-5) $169
- MINIX 1.5 for the Macintosh (0-13-585050-9) $169 (available Oct. 1)

Sales tax and shipping are extra; Prices are slightly higher outside the U.S.

All versions include the executable binaries, a detailed manual, the complete source code (on diskettes), and an attractively typeset, cross-referenced listing of the operating system code.

P-H is making a big effort to get software stores to keep MINIX in stock. The easiest way to order it is to go to a software store and ask them for it. If they don't stock it, they can always order it. Alternatively, you can order directly by email, FAX, phone, or mail from Prentice-Hall as follows.

In North America and the Far East
To order by email: books@prenhall.com
To order by FAX: (201) 767-5625
To order by phone: (800) 624-0023 or (201) 767-5969
To order by mail: Microservice Customer Service
Simon & Schuster
200 Old Tappan Road
Old Tappan, NJ 07675

In UK/Europe
To order by email: books@prenhall.com
To order by FAX: +1 (201) 767-5625 (US number)
To order by phone: +44 (442) 231-555 (UK number)
To order by mail: Order Dept.
Prentice-Hall International
66 Wood Lane End
Hemel Hempstead
Herts. HP2 4RG ENGLAND

For email and FAX orders, please include the product name and number, your
name and address, and your MasterCard or VISA card number and expiration date.
If you wish delivery by Federal Express (costs extra), please indicate so.

MINIX can also be ordered from the following addresses:

In England: The MINIX Center
Forncett End
Norwich
Norfolk NR16 1HT England
0953-89345

In Germany: Steve Steinkrauss
Feldtorweg 24
D3406 Bovenden 1
Germany

In Scandinavia: Frank O'Donell
P.O. Box 88
1371 Asker
Norway

In Spain and Deborah Worth
Portugal: Appartado Numero 50672
Madrid
Spain

In Italy: Jim Blaho
Piazza Santo Spirito 17
50125 Florence
Italy

In Greece: Vassilis Zahos
Kritonos 5-7
GR 11634 Athens
Greece

In Turkey: Atilla Gullu
Milli Mudafaa Cad 14/7
Kizilay Ankara
Turkey

If you have previously purchased MINIX from Prentice-Hall, you can get
a discount of $60, but only if you order by mail and include the label from

the original PH boot disk (or the entire disk) with your letter. Not valid for email, phone or FAX orders since you must enclose the original boot disk label (not a photocopy). Mail orders can be by credit card or check for $169. You will be billed for tax and shipping.

10. LEGAL STATUS OF MINIX
Although MINIX is supplied with the complete source code, it is copyrighted software. It is not public domain. It is also not like GNU. However, the copyright owner, Prentice-Hall has granted permission to bona fide universities to copy the software for use in courses and in university research projects. It is also permitted for MINIX owners to change the software to suit their needs and to distribute diff listings containing their changes freely. The shrink-wrap license that comes with MINIX states that you may legally make two backup copies of the software. Prentice-Hall is being much less strict than other software vendors. Please do not abuse this. Companies that wish to embed MINIX in commercial systems or sell MINIX-based products should call (212) 753-7753 to discuss licensing terms.

11. NEWS ABOUT MINIX
Since its introduction in January 1987, there has been a large an active USENET newsgroup about MINIX, comp.os.minix. It currently has about 25,000 members. Over 12,000 messages have been posted to this group so far. These messages have contained questions, bug reports, bug fixes, new software, and diff listings to allow current users to update to new releases for free. It is the intention to continue this policy into the indefinite future. MINIX users on Bitnet can be put on a mailing list by sending mail to: info-minix-request@udel.edu. Various archives store newsgroup traffic for newcomers to the newsgroup.

12. FUTURE PLANS
The major current project is bringing MINIX into conformance with the IEEE POSIX P1003.1 and P1003.2 standards. This will (hopefully) occur with V2.0, perhaps in 1992. V2.0 will also be provided with an ANSI C compiler. Various people are currently working on 32-bit versions of MINIX for the 386, and numerous other projects. To keep up, subscribe to the comp.os.minix newsgroup.

In article <A0b7wig2@mwowm.mantis.co.uk> mathew@mantis.co.uk writes:
>Has anyone tried running ST MINIX on a TT? Does it work? Anyone know of
>any plans for a TT MINIX?

A few people had modified theirs to run with 68020s, so I'd imagine half the work has already been done. Apparently the processor-specific changes are minimal. The next problem is how to utilize the new TT peripherals and such.

>orc@pell.uucp(?) \/

Is the figure "32K" a constant that you could tweak up to, say, "256K"? That would be fine for most purposes (at least for me). Granted that would increase memory requirements for editing small files (I assume), but I could live with that.

Levee was my favorite for quite some time. It's fast and seems quite robust.

I hear lots of mentions of LZH 1.13.20 and as a confirmed LZH user it looks
like I ought to be using it so where is it available from ? The best place
to distribute it would be comp.binaries.atari or failing that how about
atari.archive.umich.edu ?

Incidently, I tend to use lharc 1.13 and I find very few (or is it even no ?)
incompatibility problems.

998. TOS 1.4 question(s)

Newsgroup: comp.sys.atari.st
Date: 1991-07-04 02:15:14 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1991Jul4.021514.6315@rodan.acs.syr.edu>
Source record: 230527

OK, I don't think I've ever seen a discussion of this before, but it may have taken long ago when tos1.4 was new on the scene. I just installed the new(er) tos on an old 520 with 2.5 meg. I had put it off for a long time, and don't feel like I missed anything...I finally went ahead with it, though, in anticipation of Autoswitch-overscan (although everyone I have spoken with strongly encouraged me to do it in any case for the pure benefits). Well, I was under the impression that one of the benefits was speed...so, just to satisfy my curiousity, I ran QuickIndex before and after the installation. Much to my surprise, not every one of the benchmarks increased! And some decreased! Here are the results:
CPU memory, register, divide, and shifts all stayed the same at 99%.
64K read stayed the same at 3863
*****GEMDOS increased from 397 to 503
-----Tos text decreased from 225% to 212%
-----string decreased from 1262% to 1255%
-----scroll decreased from 180% to 133%
*****GEM Dialog redraw increased from 210% to 242%

Everything is the same (except that I got rid of fatspeed after I put 1.4 in)...I'm running QuickST, which is why the numbers are high, but I imagine other auto folder programs and accs probably affect the speed too.

Can somebody explain why more of the numbers get worse than get better?
Thanks,
Gerry

Comments about "DC Homey"..

I dunno... suppose you're in a completely "BrainDead" application that doesn't process mouse input properly..?

(I can think of a zillion examples... you forget to put a disk in A: and the program just freaks out... you get a dialogue box that wants you to "Abort or Continue" with the default set to Continue.. and naturally the mouse pointer is disabled... what'cha gonna do..?)

Hit ALT CTL LSHIFT H and the mouse is returned to a known starting position.. even without the pointer being displayed, you can at least hit the Cancel button a whole lot more easily than just clicking at random..

So it's obscure... would everyone rather have Double Click developing on the Mac instead..?

As I stated before in comp.os.minix, I intend to do a TT port.
The problem is that I'm still waiting for the delivery of the TT.
It seems they ran out of keyboards.

The changes to get things running are not that big.
However, in order to utilize the TT hardware fully, one would also
abandon shadowing. This is more work.
And finally I want to support some of the new TT peripherals.
That is: the real time clock, the scsi port and the additional rs232 ports.

I don't think this will be available from Prentice Hall before 1992.
I intend to post a beta test version to comp.os.minix before though.

A Blitter is not a co-processor.

Does the Atari blitter have 3 DMA inputs which can be combined in any of 256 minterms and output on a 4th DMA channel? is the Atari Blitter programmed by a custom graphics co-processor that runs it's own programs seperate from the cpu?

>
>> since when does the STe have Multi-tasking?
>
>Since I decided to run a multi-tasking OS on it?

Well, so how great is this OS? is not only multi-tasking, but re-entrant too? does it allow for multi-threadable applications and shared data structures? Does it have ANY form of interprocess communication, much less a standard form?

1009. MEGA STE problems (Summarise)

Newsgroup: comp.sys.atari.st
Date: 1991-07-04 12:39:43 UTC
From: johnj@echo.philips.nl
Message-ID: <1991Jul4.123943.4090@echo.philips.nl>
Source record: 230685

Hello again, I'm back on the net.

Our project moved to another location, which did
cut us from the world for about a Month.
(I have a new email address; see signature).

My last mail to the net were some questions about
my MEGA STE, I bought just then. I promissed to
summarise, so here it is.

The original postings included two questions about
booting from hard disk and some tests of ST applications
running on the MEGA STE.

Man I never have got so many responses from the net.
Thanks all of you. I have tried to thank everyone
individually by email, but I could not check for
bounced mail (as we were cut off, you know).

1. The first problem was that DEGAS messes up the screen, when
you switch from menupage to drawpage. (I mean the good old
DEGAS, not DEGAS ELITE which I didnot test).

The symptom:
After a few switchings, the right side of the screen (about
1 cm/ 0.5 inch) becomes visible on the left side of the
screen which is annoying. You have to re-boot the system
to get rid of it.

I got the following mail from Lars-Erik
>Exacly the same problem I had....
>I know of LOTS of examples of MEGA STE's with this bad chips that causes the
>monochrome diplay to wrap when you change screen adresse and causes static in
>the DMA sound, but Atari Corp won't confirm this and tell me that this is
>only a problem with my machine (but you are the 4th one I've heard about).
>Replace the chip with a chip from an old STE (not the same number so you need
>the print-layouts for both MEGA STE and STE to do this, the chip is called
>GSTSHIFTER and has to do with both video and sound in the STE machines..)
>I would again like a comment on this from Atari Corp. You can't just ignore
>this problem that applies to a great number og MEGA STE's !!!!!???

I am however not sure that this is the case, as I went to my local dealer
and tested all the MEGA STEs available. They all had the same symptoms.

Atari in the Netherlands (=Atari Benelux) reacted as follows:

1. Problem not know.
2. Hardware for screens in 1040STE is identical to MEGA STE,
so there can be no differences between them.
3. Problem must lie in the sofware itself, as TOS 2.05 is new.
They recommended another drawing package.

So, that's it.

2. The floppy drive light stays on after booting, when there is no
floppy in it at boot-time.

I got a lot of responses, telling me that this is 'normal'.
I can (have to-) accept this, but I find it a little bit strange
that this light is much more brighter than the power led.

3. It takes ages to boot from harddisk. Even when an empty formatted
diskette is in the floppy drive.

Even this seems to be 'normal' for a MEGA STE.

I got some mail telling me that if I just press a key, the actual loading
from hard disk starts earlier.

Even after trying, it did not work out for me.

Thanks to some people, I found out that you should wait with pressing
a key or moving the mouse until the hard disk spinns normally.

And it turned out to be that this was my problem, as I only have a
small desk, and I have to reposition the mouse everytime I want to
switch on the system.

It works ok when I take care to not touch the mouse and keyboard
immediately after switching on.

OK, that was all.
Thanks again to everybody who responded (or tried to).

1010. bug or virus ?

Newsgroup: comp.sys.atari.st
Date: 1991-07-04 13:22:57 UTC
From: Frank.Moehle@arbi.informatik.uni-oldenburg.de
Message-ID: <6146@uniol.UUCP>
Source record: 230684

Hi everybody.

The sun is shining hot in germany, an I have the following problem:

I am using an ST with 2.5 MB, TOS1.4, Seagate ST157N with an ICD- hostadapter
and a lot of stuff on it. I have been using my harddisk for a very long time
now, but recently my ST started behaving strage :

I can boot from my HD, open windows and so on.

But sometimes, after leaving a program, IT happens :
I return to desktop with NO open windows (I had some opened berfore entering
the program). As I try to open a window, the alart-box "4 Windows already
open, please close winsdows before opening new ones" (roughly translated)
apears. WHY ????
When I select "close.." or "close window" from the menue bar, my ST
starts playing "dead man".

Did I catch a virus (if so : how can I get rid of it) or is this just
a strage GEMDOS bug??????

please help me,
Frank

1012. Patch for ZZ-COM available thru anonymous FTP

Newsgroup: comp.sys.atari.st
Date: 1991-07-04 14:35:53 UTC
From: ralph@laas.fr
Message-ID: <RALPH.91Jul4163553@orion.laas.fr>
Source record: 230686

I do not know if anyone has the ZZ-COM communications program outside
of France, or maybe even Europe, but the author, indirectly, has asked
that his patch to ZZ-COM to make it run on Mega STe's be made
available through anonymous ftp. So I had it placed on laas.laas.fr
in the directory ~ftp/pub/atari/:

```
-rw-r--r-- 1 ralph 759 Jul 1 10:58 zz_patch.prg
-rw-r--r-- 1 ralph 2133 Jul 1 12:16 zz_patch.txt
```

Cheers,

This is a matter I think will interest anyone who plans to use a
C compiler. I sent my disks down to Goldleaf on June 21, and I received
my update today (July 4). This is exceptionally fast! You should
keep in mind that we're talking about mail crossing international
borders twice (Canada to US and then US to Canada). I would guess
that they re-recorded the floppies and had the disks on the way back
to me on the very same day or at the longest, within 24 hours of
receiving them. I should point out that I sent a Money Order, so
there would not be any reason to delay because of cheque clearing,
but even still I'm accustomed to having delays for updates far longer.

1014. Re: This week's program

Newsgroup: comp.sys.atari.st
Date: 1991-07-04 15:35:56 UTC
From: uace0@menudo.uh.edu
Message-ID: <1991Jul4.153556.1684@menudo.uh.edu>
Source record: 230687

Bob -

That is an excellent example of why we write these "useful ditties"- IMHO.

The actual purpose was brought about by the dimming display of our Stacy and the ease of losing the mouse cursor. It's very frustrating to try to find the cursor with the trackball especially in graphic laiden programs... So, off the top of my head I thought of a "homing" program that would put the cursor in a specific position on the screen- the result Yet Another Program of the Week DC Homey.

What the users end up doing with one of our programs is up to them obviously, even -sadly- file 13. ;)

We (Double Click) have a very ambitious undertaking upon us. It isn't a burden but a labor of trying to boost the Atari market and heighten our public recognition. We had hoped that others (developers and hobbiest) would follow suit and start to "rejuvinate" the user market.... Whether or not this actually happens only time will tell I guess.

- keith gerdes (Double Click Software)

PS - We like the constructive critcism that others have been giving about our programs. You can be assured that we take them into conderation each and every week.

1015. Elvis unusable on german keyboard

Newsgroup: comp.sys.atari.st
Date: 1991-07-04 15:48:02 UTC
From: sievert@gypsy.ims.fhg.de
Message-ID: <82@gypsy.ims.fhg.de>
Source record: 230688

Hi!

Some friends of mine would like to use Elvis like me - but there is a nasty problem: You can't do that using a german keyboard.

All <alt><shift>-keys generate <a><s>... key sequences. But on our keyboard all the special "UNIX" characters like [,],{,},\ and so on are shift-alt-combinations.

You shure can map them in INPUT-mode, but what about the command line?

I am using a software mapped american kb, which brings new problems with other programs.

My idea is this: Any key, which reports a valid ASCII char should be accepted as souch. Only if there is no valid char, it's a good idea to manage the keys this way.

Would it be easy to add this feature an conquer a hole new continent? ;-)

1016. Problem w/ TeX 3.1 at atari.archive (was Re: getting TeX up and running on your ST)

Newsgroup: comp.sys.atari.st
Date: 1991-07-04 16:51:58 UTC
From: ralph@laas.fr
Message-ID: <RALPH.91Jul4185158@orion.laas.fr>
Source record: 230689
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

First of all, it is true that with the new TeX 3.1, undump would
probably not run on a 1040 since the undumped file is approx. 800 Kb!!
(as David Paschall-Zimbel stated). The older Tex 2.9, I was able to
undump on my old 1040 ST and it produced something a lot smaller.
[That's for information only.]

A related question: has anyone ported BigTeX to the ST? I use the
above undumped LaTeX and it blows up since I exhaust TeX's pool!!

Now to the problem that prompted this posting: it seems that TeX and
BibTeX under the TeX 3.1 directory at atari.archive use incompatible
TEXINPUTS environment variables. For TeX/LaTeX, concerning my
application, I need the following:

```
setenv TEXINPUTS '.\acm;.;e:\tex\inputs\local;e:\tex\inputs'
```

But unfortunately BibTeX requires this to be translated to emacs'
style:

```
setenv TEXINPUTS './acm:.:/dev/E/tex/inputs/local:/dev/E/tex/inputs'
```

I would appreciate BibTeX being re-uploaded to a.a if it would use the
more std. (this is only an opinion!) TeX/LaTeX style of paths. If it
would accept both, so much the better.

| ST....

I do not see why the above configuaration should be more difficult
than the original port of GNU emacs to the ST. From the latter I have
learned that it is not easy to `dumpfix' ordinary xemacs. I suggest
to Erling Henanger to save 2 emacs images from say the gulam shell:
save one, then do a recursive call of gulam and then save the second.
Then dumpfix should work, or so I would think. This advice was sent
to me by Edgar Roeder at a time (quite some time ago) when he was more
talkative on the net.

No no - The problem in Degas IS the faulty chip !!!!!!
After I changed my chip I never have trouble with Degas !!!!!
try showing some Spectrum512 pictures (in 8 Mhz without cache).
they also gets messed up with the faulty chip (and a lot of MEGA STE's have
this chip even though Atari won't admit it yet :-) Try listening to the DMA
sound (machines with this fault also have "static" on the DMA sound)

1019. Re: MEGA STE problems (Summarise)

Newsgroup: comp.sys.atari.st
Date: 1991-07-04 17:46:49 UTC
From: larserio@IFI.UIO.NO
Message-ID: <CMM.0.90.2.678649609.larserio@kvart.ifi.uio.no>
Source record: 230693

The last weeks several people having the same trouble with their
new MEGA STE has asked me how we fixed mine, and I hope this file
can help you fix it. It's really the best machine Atari has made
so it would be terrible not to have it in perfect condition :-)

Errors on DMA-sound and video on MEGA STE - HOW WE FIXED IT !
"""

Here's a summary of what we found at service in Norway.
First - the errors on both machines we discovered were:

- Static/noise on DMA sound and MIXed standard ST sound.
- Sync-problems when using Spectrum512 pictures (vertical bars).
- Vertical flickering bars on monochrome (most at 8 MHz).
- Right edge of monochrome screen "flips" over to left edge
when changing screen adress/resolution in mono-mode.

We tried to find a chip that could be the cause of all these
problems and found a big VLSI chip partly hidden under the right
edge of the VME-card holder. It's chip U502 on my MEGA STE and
is called GSTSHIFTER on the print-layout. After looking at the
print-layout on both MEGA STE and standard STE we found the same
chip on standard STE, a combined sound/video chip but with a totally
different part-number. Anyway, we removed the original MEGA STE
chip (made in 1990) and replaced in with the STE chip (from 1989)
and all the problems were gone. If you want to "steal" a chip from
a standard STE it's chip U401 inside the STE (still GSTSHIFTER).

Disclaimer: Even though this solved the problems for us it might not
work for all MEGA STE's and you do this at your own risk

(I still would like Atari Corp to give some official information on
this. It's not "ONLY YOUR MACHINE" anymore. It's quite a few...)

1020. Double Click programs

Newsgroup: comp.sys.atari.st
Date: 1991-07-04 18:04:57 UTC
From: rjast1@unix.cis.pitt.edu
Message-ID: <147814@unix.cis.pitt.edu>
Source record: 230694

I was trying to think of some useful utilities that Double Click could possibly implement. What I personally could use (and am wondering who else too) is a generic keyboard changer - i.e. right now I have my mouse disconnected, and have to use the ALT-arrow keys to move the pointer. But it would be much easier just to hit the arrows by themselves. What I'm thinking of is a program to simply let you rearrange what keys do what - this could help people with different keyboards (German etc) where you could set up the keyboard as you like. Easiest way I can think of is as an AUTO program, with maybe a small config file, just denoting what keys will act as what other keys, and leaving everything else alone.

I dunno if there is such a similar program out there, but it would come in very handy...

Did you ever try to boot from floppy, i.e. with no programs resident? Maybe
there is a resident program which causes the trouble. Otherwise it seems to
me as if there is something wrong with your ST, probably something concerning
ram or rom. I don't think that there is such a bug in TOS 1.04 because I never
heard of it and never had these problems.

Hi Jan,
Well about putting an internal hard drive inside of your
Mega ST2; personally I would recommend using the ICD AdSCSI Micro Adapter.
The AdSCSI Micro plugs directly in the the Mega ST's internal DMA port and a
power connector already provided for (by Atari) on the inside of the machine.
The AdSCSI Micro also includes a mounting bracket (the holes are already in
the Mega ST's motherboard, you won't have to do any drilling), cables,
software and manual.
One note though, use a hard drive with low power requirements.....
such as the Conner or Quantum hard drive mechanisms. Bye.....

Luis

1023. TT monitor compatibility

Newsgroup: comp.sys.atari.st
Date: 1991-07-04 20:24:05 UTC
From: ford@tardis.computer-science.edinburgh.ac.uk
Message-ID: <9107042136.AA09957@ucbvax.berkeley.edu>
Source record: 230698

Could someone (probably someone with a TT) tell me what sorts of monitor the TT can drive?

Can it drive the Atari SM124 monochrome monitor?

Is the NEC 2A Dual-sync monitor suitable?

Is the NEC 3D Multi-sync monitor suitable?

What are the monitor connections like on the back?

I ask these questions as it will depend on the answers as to when I buy a TT, ie will I have to wait till I have enough for just the TT, or do I have to wait till I've enough money to buy the Atari monitor as well.

I'm sure many prospective TT owners would like these questions answered, so I suggest that answers be posted to the net.

Personal Pascal 2 trouble...
"""""""""""""""""""""""""""

I have a small problem with my Personal Pascal compiler.
When the compiler has been run several times (10-20 with TOS 1.4
but only once or twice on 2.05) GEM crashes the next time I start
a GEM program. This is very annoying when I work with a new Pascal
program: edit - compile - crash, reboot - edit - compile - crash etc

Does anyone know what's the matter ????
The only thing I found was that the compiler does NOT call
appl_exit when the compile was successful (could this cause
GEM to crash the next time appl_init is called). Could this
be fixed with a patch program, or could someone fix the compiler
so it calls appel_exit before it quits (I'll pay for the job !!)

If someone has the soulution please tell me (this is so important
to me that I'll pay quite a bit for it if it fixes the problem :-)

No, it is the same as the Mega ST's blitter chip. The STE only has extra chips for scrolling horizontally and vertically.

1026. Tos 1.4 software

Newsgroup: comp.sys.atari.st
Date: 1991-07-04 21:06:23 UTC
From: selick@bucsf.bu.edu
Message-ID: <85215@bu.edu>
Source record: 230697

I have a 1040 STE with tos 1.6, and I wanted to have an older version
for tos on file just to look at. Is there a software version available?
I could whip up a quick dumper program to put tos into separate files if
necessary. Would that conflict with copywrites? Keep in mind, I have
1.6, and probably can't do anything with 1.4 anyway.
later,
Steve

>Hit ALT CTL LSHIFT H and the mouse is returned to a known starting position..

I usually just move the mouse (unseen) to one of the screen corners.

However, rather than complaining about the program, we should be SUGGESTING
ideas. I notice DC GTP - a program all the non-CLI users wanted. Well done
DC - and thanks for listenning!

This is one of MY feral massages to the fears of the Atari ST community.
I am very, very sorry. That is, I have had to get rid of my ST and
leave this community. Note that I have been unhoppy with Apple, and I could
not afford to place two computers on my desk, and the ST had to go.

[*** lots of stuff deleted ***]

So far, a rather sad story, yes? _I'm_ cryin'. My ST is gonna go, too.
I don't have room for two computers either, so my ST is going to get
shoved aside. What is the new machine? A TT, of course. :-)
Geez, gimme a break from sob stories.

In article <43995@cup.portal.com> Bryan_Jones_Woodworth@cup.portal.com writes:
>Tell me more about Stealth. What features does it offer, etc etc?

If you have seen the shareware program "Hagterm", you've seen Stealth. It is just an attempt to sell HT for money. Unfortunately (IMO), Stealth demands too many resources and offers too few features (and no innovations) to be worth considering.

File transfer protocols? ASCII, XModem, XModem 1K, XModem CRC, YModem, YModem G, and ZModem (via running XYZ.TTP seperately). Terminal emulation? VT-52, VT-100 (which doesn't work properly), and ANSI (which doesn't work correctly either). Oh, it's also TT-incompatable, requires at least 1 megabyte of memory, and offers one of the most confusing, amateurish user-interfaces ever seen on the ST.

There's a lot of hyped-up "frills" for Stealth (when a file transfer is done, it doesn't ring the bell, it plays a musical song -- whee), but it's all air and no innovation. I myself say that a large part for its problems is that it's written in GFA BASIC ("real programmers don't program in BASIC", as the old joke goes), and the author is too busy trying to "out-feature" Flash! that he forgets about solid design.

(Notice that Stealth is being sold by the PDC [Public-Domain Company], which has a known bias for GFA-BASIC-written products. "So what if it's not good? It's written in GFA, let's sell it!")

Stay with Flash, Interlink, or Uniterm. Those are proven products that cost less, do more, and maintain your respect in ST software. Stealth is nowhere near the level of quality of those products, though it does offer more air than the rest...

--R.J.
B-)

P.S. Yes, I have seen it. Yes, I have used it. Yes, I don't recommend it.

':map! #<a>; [' works in input- and command mode. It doesn't, however, work
in ':'-mode. But most unfortunately <alt>-"o and <alt>-<shift>-"o produce
the same code, so they can't be mapped to '[' and '{' respectively.

From article <59956@aurs01.UUCP>, by whitcomb@aurs01.UUCP (Jonathan Whitcomb):
> I've heard Gribnif usually has outrageous upgrade fees... one of the
> reasons I steer clear of their products.

That's not been my experience. I think the upgrade fee from NeoDesk2 to NeoDesk3 was $20. I thought that was quite reasonable, given the extra features.

Of course, as with all too many topics mentioned in this newsgroup, what counts as reasonable, inexpensive, etc. depends a lot on where you live. In general, we in the UK seem to pay more for lots of computer-related things, so this obviously colours my perception of Gribnif's prices.

I've found their support to be good over the years - I think I'd be willing to pay a little something for that alone.

Graham

Hi all!
I have a question about monitors for the TT:
Is the TTM 194 a color or a monochrome monitor?
What monitor would you recommand me?
Is it possible to use (S)VGA with the SuperCharger + with a VGA card
and a TTM194?
What about the SM194?
Is the 1248*800 resolution monochrome or color?
Is it possible to use (S)VGA monitors for the TT?
Please reply by e-mail.
Ciao,
Joerg.

I dont think that ATARI is doing so bad in Europe. The new technologies
like ST-Pad and a notebook Atari are a sign of a progress.
MsDos is not a good system, because its now 10(!) years old, and you
are more busy in finding the driver for ... that fits, than in working.
You cant compare the TT with the Next because the Next is approximately
2 times as expensive as the TT.
The ST is doing well at universities and DTP and things like that,
at least in germany.

|>

It's not necessary the speed of the printer that is the bottleneck but the
transfer rate of the data to the printer. The SLM605 is only a 6page per
minute printer but it actually churns out that many pages of 100% graphics
when driven by most program including Calamus. For the record the SLM605 like
the printer for the Next has no processing power but used DMA to access the
page image from the host computers memory, thus the very fast printing. The
disadvantage is that you loose 1Meg of memory for the page image and the
printer can only be used with an Atari. Now if only I could afford the
900pounds to buy one.

>That uses the graphics routines. and how many don't? how many do?

Nearly every program does. There are some, like Tempus, which use
hand-tailored screen output routines (which is considered illegal),
but even those programs will profit from the blitter when displaying
dialogs, windows and menus.

>>What "same thing" were they trying to do? Implement an Amiga OS, perchance?

So they probably had no idea how to use the VDI graphics library. Which is,
IMHO, at least as easy to program as the Amigas gfx library.

For quite a while now I've been moving postings from
'comp.binaries.atari.st' to local BBS's. I seem to be the only
person in the Toronto area who has had access to that newsgroup.
Just yesterday the administrator for 'lsuc' (the node from which
I downloaded the 'binaries' group) decided he can no longer
afford to receive that group. He also dropped 'comp.binaries.mac'
and 'comp.binaries.amiga' and a few others. They are still
receiving 'comp.binaries.ibm.pc'.

Now, a lot of the guys in this group have the mistaken
impression that "hundreds of messages means you have a healthy
newsgroup." Well, that's not necessarily so. I'm not going
to say that the current debate about the relative merits of
a discussion about Atari ST's and Amigas is necessarily stupid
or without value. It isn't. A lot of valuable information can be
spread around in such discussions. But keep in mind that it has
taken up a *lot* of bandwidth recently. Was it the direct cause
of our losing the 'binaries' groups? I don't know for sure.
But without doubt, we have had more posted on that subject than
all the postings in both the Amiga and Atari 'binaries' groups
combined. Assuming that this is a direct correlation, was it
a fair trade? I'd say it wasn't. As far as I'm concerned, we
lost some of the most valuable material available to Amiga and
Atari ST's for some rather trivial information that most of us can
find out, if we're interested, by going out and buying a couple
of manuals.

Are there any good points to this? Well, as far as I'm
concerned, I'll have more time now to do other things than unpacking
'binaries' postings and uploading them on the local BBS's. I
haven't found much over the years that I felt was worth keeping
anyway. If the 'sources' group was dropped, then I'd *really* be
upset, but we're still getting the 'sources' groups. And mentioning
that, I think it's a good time to again ask for people to post
'sources' rather than 'binaries'. But that's about all that I
can see as possibly being good about it.

Anyway, thank you all for losing the 'binaries' groups for
us. I'm sure the local Amiga and Mac users are also thrilled.

Question: How many Atari and Amiga users does it take to change
a light bulb?

Answer: 1 of each and somebody to carry the remains to a hospital
after the manditory fight about who can do it better.

I have a normal STE and the "flipping" happens on it, too. I just used a PD
colour emulator and .... it looks terrible. AND - a friend of mine owns a
Speed Board (Turbo 16) that is built into his STE, wonder what happens?
Yes, it happens on his machine, too.

[about the 32k file limit in Levee]:
|
|Is the figure "32K" a constant that you could tweak up to, say,
|"256K"?

Yes, it could be tweaked up to 256. With a recompile. Though I warn you-
it will be s*l*o*w when you get up to 40+k of file, because one of the more
repugnant bits of Levee is the way that I store the file - it's one long
continuous block of characters, and when you're inserting at the start of
the file, well, block moving 40+k of information can get pretty ugly.
(For people keen on historical trivia, I store the file as a continuous
block because when I first wrote Levee - in 1979(!) - the editor I used
as a reference was the UCSD Pascal editor, which did exactly the same
thing (and on a 56kb PDP-11/02, you're lucky if you can get more than
about 20kb of file - the USCD editor managed to read about 16k files,
but Levee, after one or two massive coding marathons, was able to fit
a 21k file into core under the (unmodified) UCSD system, and about 22k
under the much modified version we (the Terak hackers at Madison) played
with.

People may wonder why I've not released the source to Levee. Well,
that's one of the reasons. Everybody needs to learn how to program,
and Levee is how I learned :-)

If people are interested in a mega-Levee, send me mail and I'll
mail off a copy of it when I get it recompiled and working.

1050. Lattice C Assembly Lang.

Newsgroup: comp.sys.atari.st
Date: 1991-07-05 18:33:27 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1991Jul5.183327.20255@lsuc.on.ca>
Source record: 230533

1991/07/05

Problems: Lattice C, version 5.06.02

So far, the only major problem I've found with Lattice C
is that they don't give you enough information to fully use assembly
language. In most "ordinary" C compilers this isn't a major
problem. The Sozobon C compiler essentially lacks information
too, but I was able to use the Sozobon Compiler system to produce
samples of assembly language code and thus learn enough to
produce assembly language subroutines which were callable by
Sozobon C sources, freely intermixable at the linker level.
The reason it is possible with Sozobon C is because the compiler
compiles down to a normal text Assembly language source file.

Lattice C doesn't do this. The compiler compiles down to
a "compressed" intermediate file which cannot be analyzed by
normal text oriented tools. So the lack of documentation in the
manuals becomes an almost absolute barrier against solving the
problem. The only recourse seemed to be the OMD utility which
disassembles the ".o" files. One would presume that it would
dissassemble back into a directly assemble-able source file,
but strangely, it doesn't.

Having worked at it a bit, I think I've found out enough
from the OMD utility and the ASM assembler and CLINK linker to
go ahead and produce some assembly language subroutines. But I
thought I'd share this experience with you a bit so you can better
judge the current state of the Lattice C compiler.

The following is the sample "test.c" program I wrote:

```
#include <stdio.h>

int main(var1,var2,var3)
long var1;
short var2;
long var3;
{
var1 = var1;
var2 = var2;
var3 = var3;
return 0;
}
```

This was compiled with the '-d' switch to produce an object
file that the source code could be referenced with the OMD
disassembler. The following is the output of the OMD disassembler:

```
---
Lattice ATARI 680x0 Object Module Disassembler V5.06
Copyright = 1990 Lattice, Inc. All Rights Reserved.

Lattice Object File Loader V1.00
68000 Instruction Set

EXTERNAL DEFINITIONS

_main 0000-00

SECTION 00 "test.c" 00000020 BYTES
; 0: #include <stdio.h>
; 1:
; 2: int main(var1,var2,var3)
; 3: long var1;
; 4: short var2;
; 5: long var3;
; 6: {
| 0000 BFEC 0000-XX.2 CMPA.L __base(A4),A7
| 0004 6500 0000-XX.1 BCS.W __xcovf
| 0008 48E7 0700 MOVEM.L D5-D7,-(A7)
| 000C 2E2F 0010 MOVE.L 0010(A7),D7
| 0010 3C2F 0016 MOVE.W 0016(A7),D6
| 0014 2A2F 0018 MOVE.L 0018(A7),D5
; 7: var1 = var1;
; 8: var2 = var2;
; 9: var3 = var3;
; 10: return 0;
| 0018 7000 MOVEQ #00,D0
; 11: }
| 001A 4CDF 00E0 MOVEM.L (A7)+,D5-D7
| 001E 4E75 RTS
---
```

The above output is *not* assemble-able. After mucking around
with it a lot, I finally derived the following source code which
does NOT assemble down to an identical ".o" file, but after linking
DOES link down to an identical ".prg" file:

```
---
SECTION "test.c"

XREF __base * This seems to be a standard address
XREF __xcovf * This seems to be a function
XDEF _main

_main CMPA.L __base(A4),A7
BCS.W __xcovf
MOVEM.L D5-D7,-(A7)
```

```
MOVE.L $0010(A7),D7
MOVE.W $0016(A7),D6
MOVE.L $0018(A7),D5
MOVEQ #$00,D0
MOVEM.L (A7)+,D5-D7
RTS

END
```

I'm, not going to detail all the differences, but I'll point out that althought the manual emphasises use of a CSECT, no CSECT was created by OMD, and though I found no information in the manual about a SECTION, OMD refers to one. But a SECTION does not seem to correspond to a CSECT.

At this time I'm only going to point out that I could not figure out a ".S" file that would assemble down to an identical ".O" file, and that the output of OMD seems to supply enough information to figure out what you need to know -- given time and effort. But I bought the Lattice compiler specifically so that I would NOT have to spend such time and effort "hacking" solutions to such fairly common problems. I've mentioned the problem to the distributor when I returned my disks for upgrade and no reply has been given so far. As I've said, I seem to have solved the problem. I'll be writing some assembly language routines over the next week.

1052. Amiga/Atari

Newsgroup: comp.sys.atari.st
Date: 1991-07-05 20:31:25 UTC
From: ykidron@isis.cs.du.edu
Message-ID: <1991Jul5.203125.3818@mnemosyne.cs.du.edu>
Source record: 230528

Hello there!

I would like to comment over the latest issues posted in this news net. I was really stunned after I've seen the total amount of gibberish non-sense submitted by other computer users. I was so shocked, I started laughing at it.

Let me introduce myself first. My name is Yaron Kidron, and am an Atari ST user for the last 5 years. I bought my system way back in '86, and have been using it until now. I am a free-lancer, and currently I am studying for my first degree in computer science.

I define myself as a computer user. Computers are my hobby, and my job too. I like computers of any kind and brand. Anything that bleeps and processes it's data digitally, would most likely be admired by me. I see no sense in claiming that any computer is better then the other. This is a truly unforgettable and childish way of thinking, resulting in some really abnoxious flame wars.

In the last 9 years I programmed and used many computers. I started right off with the Timex ZX81, then the Spectrum came along. After that, I met the Atari 800XL and the Commodore 64. A year after, I happily programmed an IBM PC, and later got in love with the Macintosh. Then, I bought my ST system, and developed 68000 code, both on the Amiga, ST and the Mac. At present state, I am working on a IIci and a 386 machine. They all served me great, and still I'd like to use the older ones once in a while.

A person which compares computers by specifics and raves the differences around is not a computer enthusiast. He is a dimwit which I wouldn't like to see using a computer. Computers is not his profession or hobby, and he would more suitable to be a politician. Tom, that line was refered to you.

Furthermore, A computer can not be compared to other computers. As I see it, my computers are as dear to me as others pets. You can not compare a dog to a cat, either financialy nor mentaly. A computer is a complex, non-linear construction of electronics, software, and evidently, money. I can never do any comparison of my 386 with my Casio fx82 calculator. There are things my 386 does better, but there are things my Casio can do better as well.

Bringing us to the matter. Comparing non-linear concepts with a linear (our mind) material is totally worthless. I programmed the Amiga, and I programmed the ST. But I never said to myself: 'Oh look, that routine runs better on that Commodore machine'. No way. I just done my job, and enjoyed both of the worlds. Why fight? Why bring up such stupid text to a network? Why tire the computers for such bullshit?

The ST is a fine machine. It's great. So is the Amiga. I have many complaints for Atari themselves, by not supporting their machine, but I have no problems whatsoever with the machine itself. As a package, enclosed with a very

resonable price, the ST is a winner.

In some occasions, people look at the spec sheets of computers and start comparing. 'Oooh. That one is 25Mhz.... My ST is only 8!'; Gosh, I think to myself, why don't they get satisfied with what they have, if that machine serves them as much as they need it? I bought the 386 just because my ST didn't fit with my job. I couldn't develop software for the Intel's on my ST, so I had to buy a new machine. It wasn't because my 386 is 33 Mhz, and has better graphics. It was because I needed a different tool. This document was processed on my ST, since I like using it more for WP.

Don't get me wrong though. Tom, the Amiga is a fine machine. I enjoyed using it when I had to work on it. But still, the ST is just as fine. Coming to think of it, my Timex Spectrum is better then both, when it comes to introduction of computers. I have done my first programs on that baby, and it was easier to program then both of these younger machines. Although that old bastard is way too slow by todays standards, I'd recommend it to any young chap that wants to get into computing.

Peter, it seems that you have to learn a lot too. People did not invent computers to make their users flame at each other. Certenly not on such public places. I really don't think that it was wise of you to follow Tom's footsteps. Try to enjoy the Amiga. It's a swell piece of electronics. Don't try to rave about it around street corners, because I know people who would say it is a piece of crap, compared to their Sparc Stations at work or PC's at home.

Golly, I need to finish this message sometime, don't I? Well, as for the last comments about Commodore's doings in the last months or so. Commodore is doing very good, especially in Europe. It is mainly sold as a home computer, and gradually replaces the ST in many homes. This might be sad news to many of you, but I don't look at it that way. I am a computer lover. I like computers in all shapes and forms. As long as my ST serves me, even if it will be the last one on Earth, I would not try to compare it to others, and replace it.

Finally, lets keep this stuff of the net. It's just a waste of money, and dear, the life of precious computers around the world. Stop it. It looks like a mud fight in the sewer. Tom, Peter, enjoy your machines. I'll enjoy mine too. Behave yourself dudes, grow up. Or otherwise, steer clear from computer life. It is not for you.

Any multisync with the right sync rates are fine. Yes the 3d is nice, but it is too much. LOOP technologies maked a ultrahires (1024x768) non-interlaced analogue multicync for ~395.00. Can't beat that.

Hi Chris,

Yeah, you're right. Just look at a.a for CLI10U.LZH, the powerful
command line interpreter of Oliver Scholz. There you have an build-
in format command with HD option. This is not the only reason why
you should have it. Just look into the (german, sorry 8-( ) docs
for detail.

BTW: english docs will be avaiable soon 8-)

Have fun,

Lars

I've had a couple occasions where I had a dialog box appear in a TOS program without the mouse present and had to play hunt and peck for the Non-Default buttons. I also lose the mouse FREQUENTLY when calling up DTerm (or other programs) from within my (TOS) bbs software. Trying to center an invisible mouse is not the funnest thing to do... DC Homey definately makes MY life easier.

THANK YOU DC SOFTWARE!

1057. Portfolio in T2

Newsgroup: comp.sys.atari.st
Date: 1991-07-06 03:46:23 UTC
From: iho@akbar.cac.washington.edu
Message-ID: <1991Jul6.034623.14597@milton.u.washington.edu>
Source record: 230537

I know that this isn't really about ST's, but I've seen stuff about other Atari products here. Nobody's mentioned this yet. They clearly use a Portfolio in Terminator 2. John Connor (Linda Hamilton's character's son) uses it to "plug into" a bank ATM and steal money. It looks like somebody at Atari was on the ball with this one.

And you think that a laser printer can print 1 megabyte a second? I'm no apple advocate, but the speed of appletalk can certainly keep up with the fastest laser printers on the market today for PC's. (pc is generic here). course i suppose that those atari printers aren't postscript either. have you used a laserwrite IISC (scsi laser printer). scsi is alot faster than appletalk, yet they print at the same speed.

>(and no innovations) to be worth considering.

^ quote from an article by jjung@nunki.usc.edu

Hey there! I remember you from rec.games.video :)

I have used "Hagterm." I did not like HagTerm. It just doesn't appeal
to me; yet, I applaud the person who programmed it. If everyone tried
to write product, we would have a lot more software :) Hehehehehe

Thank you for the bash, I'll avoid Stealth at all costs!

1061. SLM605 vs Mac Lasers

Newsgroup: comp.sys.atari.st
Date: 1991-07-06 09:33:36 UTC
From: CSULLOGG@CRL.AECL.CA
Message-ID: <30653@know.pws.bull.com>
Source record: 230210

In response to a query, have I seen the new Mac lasers, sure - there is a very big Mac user community on site. When it comes to bit mapped graphics, the 68030 in the Mac laser won't help if you're waiting for the file to go from the Mac to the laser via Appletalk. Via the fast DMA with the ST/SLM605, bitmapped graphics zoom out. I agree that Postscript is great and rally makes things faster but, sorry, it means squat for bitmapped graphics cause dots-is-dots. Do a lot of DTP with digitiezed pix and you'll see why the ST/SLM605 outperforms the pack!!!

Finally, the Amiga user who said that ST users are too defensive is right! I love the feedback from other groups even though I am an avid ST user.

Source record: 230543

i read on the amiga net that you can remove 68000 chip and replace with 8 mhz 68010 for faster operation hardly no software problems if you do there are software patches to help.can this be done on the st;s? also the can put a 16 mhz 68000 with ram chip and software patch to run faster also.can this also be done on the atari and why not.they seem to have a good cheap upgrade fix for thjose who cannnot afford 500 for a fastv 68030 board!

Hi,

R C Smith robin%castle.ed.ac.uk @ SUB wrote:
RC>>The shareware-contribution should be 50.-- DM.
RC>What is 50 DM in either \pounds or $?

The problem is, that Sigma-Soft (which distributes Midimaze II) has the rights of the name "Midimaze" just in Germany and Austria. So they are not allowed to distribute it in the US or somewhere else.

BUT: If you will ship some kind of gift to them, they will send you a new copy of Midimaze II :-).

The DEM 50,-- is the shareware-conrtibution in Germany. So, if you want to get Midimaze from the US, think of a bonus. DEM 50,-- are probably 30 US-$

Ciao,
struppi

1066. More on what Atari does have

Newsgroup: comp.sys.atari.st
Date: 1991-07-06 10:57:09 UTC
From: CSULLOGG@CRL.AECL.CA
Message-ID: <30665@know.pws.bull.com>
Source record: 230541

Since my original posting about the performance of the ST/SLM vs other CPU/laser combos, I have seen additional support for my position that the ST/SLM cannot be beat for speed and diversity of software that uses that speed. The best move that Atari could make would be to market the SLM605 laser with an PC interface board and a 40-50 meg hard disk. The whole unit could retail for <$1500 CDN, including UltraScript.

The PC users could get FAST, FAST outputs like SLM605 users now enjoy. The hard disk could be set up with a printer server to handle multiple jobs from a variety of users.

I tried to us MS Windows 3, with a QMS Jetscript board to print out PS files from Windows applications, such as PerFORM/perFILL. After talking to Delrina (PerFORM folks), HP (it owns QMS) and Microsoft, we had to abandon the project. Outputs were just too slow to be useful. Broke my heart that I wasn't allowed to use an ST/SLM605 due to a total reluctance to forget the PC based system.

Try to copy Files on A Amiga and format disk, all there commands are external,
they have to be loaded from disk, that is why they have to use 2 disk drives,
also they only write tracks, not sectors, and with out CRC checking,
they only do sum checks..
Also all the Virus problems that they have, you can't write protect
the disks as they don't use a dive controller ic.
There file format is very Slow and there machine runs some 30% slower
than a ST, this is because of the wait states that they have, no transparent
video or ram refreshinger.
I know I had one, all it was good for was Games.?

1068. IMPORTANT NOTICE about BART

Newsgroup: comp.sys.atari.st
Date: 1991-07-06 15:08:37 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Jul6.150837.523@terminator.cc.umich.edu>
Source record: 230546

```
Due to a problem with address conversion, bart will be down until
further notice. Or at least until Jon gets back from vacation. :)

For those of you that care, the problem is this: when bart returns mail,
he cuurecntly converts all addresses to lowercase. Problem is, it's converting
lowercase to control characters, thus generating a fair number of
sendmail errors and generally creating mass havoc.

Bart will be on line as soon as the problem is corrected. In the meantime,
please save everyone's machines a whole lot of trouble and DON'T bother
sending mail.

Keep your feet on the ground and keep 'em there,

weiner

1069. STe vs. ST (wow, finally upgraded)

Newsgroup: comp.sys.atari.st
Date: 1991-07-06 15:42:07 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <7842@vela.acs.oakland.edu>
Source record: 230547

Hello all! The local ST store just got my old STfm since the replacement internal drive finally kicked the bucket. They worked out a swap with me on new 1040 STe, and now I am wondering what all the netland folks suggest I go looking for first to best show off my new toys' talents. I am just wondering what this thing can do. ie, what are some of the new sound demos that will show off the stereo sound, and what is the picture format for me to show off all of my new colors??

Any other nifty program suggestions would be appreciated.

swood

> suppose that those atari printers aren't postscript either. have you used a
> laserwrite IISC (scsi laser printer). scsi is alot faster than appletalk, yet
> they print at the same speed.

The Atari SLM804 and SLM605 are not PostScript printers, they are bit image printers, like the NeXT printer. They rely on the host computer to build the image, which is dumped across the DMA interface at high speed. The bit image will be several megabytes in size.

The bit image can be built by a PostScript interpreter running on the ST or TT, or it can be built directly directly by the application software. PageStream lets you use either method. Calamus requires the latter method, as do applications using GDOS.

A PostScript interpreter running on a ``slow'' 68000 in the ST may actually be faster than a dedicated PostScript printer running on a much faster CPU, depending on the nature of the image to be printed. If the project involves lots of fonts that have to be downloaded or -- worse yet -- bit images, the i/o to the PostScript printer becomes a serious bottleneck. A project involving scanned photographs might benefit significantly from a faster interface, such as SCSI.

But regardless of where the PostScript interpreter resides, it is inherently slow compared with direct imaging and a fast DMA bitmap dump. PostScript introduces a middleman whose presence always slows down the process. Calamus can build and output eight complex pages with multiple fonts, vector drawings and sophisticated halftone shading before a PostScript printer can finish the first. You don't have to take this on faith; you can go to any Atari dealer and watch it happen.

There are advantages to PostScript printing, including font availability and quality, and portability to high-quality output devices (although Calamus does have a Linotronic option). But speed is not a PostScript asset.

> Anyway, thank you all for losing the 'binaries' groups for
>us. I'm sure the local Amiga and Mac users are also thrilled.

Umm... how is it that your administrator killed comp.binaries.st
because of heavy traffic in comp.sys.atari..?

Why not kill the one generating the traffic? I'm afraid I don't see
the connection...

Or did you mean he killed ALL .atari groups..?

1073. CAD programs

Newsgroup: comp.sys.atari.st
Date: 1991-07-06 22:29:19 UTC
From: yegerleh@vivaldi.ecn.purdue.edu
Message-ID: <1991Jul6.222919.7543@noose.ecn.purdue.edu>
Source record: 230550

Hello Everyone,

Does anyone have first-hand knowledge of the following CAD programs:

Drafix 1
Master CAD (Michtron)
Athena II
First CAD level 1 (Genereic Software)

Beyond any general impressions you may have, I am also interested in
knowing if they support DXF format files, and what kind of printer drivers
they come with.

Also, can any of you guys in Germany suggest a CAD program? Seems like
the last time I vistited my Swiss relatives there was a program called
"BeckerCAD" advertised in ST Magazin. German docs are no problem.
Price and oredering info would be helpful.

I can summarize responses and post to the net if there is interest.

Thanks,
Jim

please get newer versions of utilities (especially gcc-ld.ttp and
sym-ld.ttp) from atari.archive (Patchlevel 17 or better, the current
Patchlevel is 21). these versions should never ever give you the
dreaded "bogon alert" message. while you are there also pick up a new
version of gdb (gdb v2.6 Patchlevel 12). "gcc -g" (note NOT -gg) works
just fine now. also, this version of gdb is very usable on the atari
now.

if you ever get "illegal character" errors from gas (v1.38) when
compiling with `-g', then you need a newer version of gcc. I had
posted the required Patch for gcc-1.39. gcc-1.40 has these fixes
already incorporated, so if you see the error from gas, please grab
the new gcc v1.40 fom A.A.

cheers,

Hardly, they are not "combining forces" they are merely exchanging technology.
and that still has 6 months till the contracts are signed. i think you'll
see things change if/when the contracts are signed, Ego's are big at both IBM
and Apple.

In article <678509203.0@therip.FidoNet> Rod.Fulk@f24.n228.z1.FidoNet.Org (Rod Fulk) writes:
B> That's what many people say, until they try Amiga multitasking.
I have seen people use the multi tasking.. The main reason for multitasking is that on the amiga many programs just have general functions due to the fact that many other programs can do these functions well. On the ST MOST of the programs that are out now [...]
Anyhow, MOST of the ST programs out now have many ways of getting some of the important features done in a "multi tasking" environment.

In other words, the authors of utility programs in a monotasking environment must go out of their way to provide functions that the system (or other utilities) provides in a multitasking environment, just because you can't access the external functions without exiting the current task.

This is a lose for two reasons. First, you've got all those utility writers re-inventing wheels. This is largely wasted time; they should be making their utilities better instead. Second, chances are pretty good that all those re-invented wheels won't look the same, so the users of those utilities will have to learn multiple different ways of acheiving the same task. This is a waste of the users time; they should be putting their computers to work, not learning N different ways to format a disk (or whatever).

On the amiga multitasking is very useful for the current software do to generalizatins..

You're missing the forest because of the trees. _Any_ software designed for _any_ multitasking system will be "generalized" in this way. They always have. After all, if the user can suspend/detach/iconify/shelloutof your program and do X no matter what X is, you don't need to worry about doing anything but what your program does.

(Games don't count since most dont multi task even on the amiga.. I am talking games like falcon etc.. Some you CAN multi task but you really do not wanna do so unless your running a fast machine)

Well, most of the games I can buy multitask - partly because I tend not to buy games if they don't. Of course, I also find arcade games boring, and stick to strategy games. There, the multitasking is a great help - I can take notes in the editor, grab a calculator to crunch on some probabilities, etc.

But why? It already can do all I need for it

That's the bottom line on buying a computer. If that's true, you bought a right computer for you, whether it's a 4MHz z80 running CP/M, or a NeXT box...

From: miskinis@aidev.enet.dec.com
Message-ID: <5485@ryn.mro4.dec.com>
Source record: 230554
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I grabbed all 29 parts of the GNU emacs archive. I can't get it to work. It says in the "read_me" file that the termcap library is used, and that a sample file is included. I didn't see one!

I logged onto Genie, pulled the TERMCAP archive, and it has a TERMCAP file in it. It seems to define "st52" and "st52l" (50 lines). I tried setting the TERM environmental to st52, but it still complains that st52 is not powerful enough to run emacs, and it lacks the ability to move the cursor.

It hasn't been a fun Saturday! If anyone knows how to get this working I'd love some help!

Thanks!

John

> (as David Paschall-Zimbel stated). The older Tex 2.9, I was able to
> undump on my old 1040 ST and it produced something a lot smaller.
the size of the undumped executable depends on the
configuration you use to compile TeX to size the arrays. for TeX 2.9 i
made up three configurations, for 1, 2 and 4M machines (see "tex.h").
similar sizing of the arrays can be done for TeX 3.0. The size in
memory of either the undumped or straight executable is no different.
Only the size on disk differs because the BSS section is now stored as
initialized data.

>
> A related question: has anyone ported BigTeX to the ST? I use the
> above undumped LaTeX and it blows up since I exhaust TeX's pool!!

dont need to port anything, just size up the arrays, and
re-compile. make sure that you size them so that you can still fit the
executable in memory.

> BibTeX under the TeX 3.1 directory at atari.archive use incompatible
the source for bibTeX was never posted (jeff long???) unfortunately.

>also be done on the atari and why not.they seem to have a good cheap
>upgrade fix for thjose who cannnot afford 500 for a fastv 68030 board!

There are (at least) two companies selling 16MHz 68000 kits for STs. No software patches are required, and both kits come with fast RAM caches to increase throughput.

TOS versions older than 1.6 cannot cope with 68020 or higher, and probably need patching to handle 68010 as well. The 68010 offers such limited speedup, it's not likely that many (old) TOS routines are written to take advantage of the 68010 loop mode.

Dave Small has posted a couple times in the past about 68030 upgrades for the ST and STe. The STe's TOS is already compatible with the 68030; the ST kit comes with a patched version of TOS 1.6 from the STe... The trick is to interface the 68030 with the 16 bit 68000 bus. Dave Small seems to have solved that problem, as have a few other folks.

cummins@d.cs.okstate.edu (John Cummins) writes:

> AARGH....... Seems I needed lzhcatch2 also.....
>
What is "LZHCATCH2" for? All you need is the program LHARC.TTP to use
Lharc. At least that is all that I use. Here are the command lines for
add and extract.

Add:

a A:\EXAMPLE.LZH B:\DATA*.*

The first filename is the name of the archive, and the tells LZH where to
get the files to compress. If you want to compress entire directories,
use the '-r' switch. That will take files from inside folders as it
goes. When it extracts, it will even create the folders again. I'm not
sure how to use commens, though.

Extract:

x A:\EXAMPLE.LZH B:*.*

The second filename is optional. It only says where the files are to go,
or what file (or files) to extract if it has an actual filename or a
filename with wildcards.

Lharc 1.1321 is the standard, so try not to use the older programs that
are only partially compatible.

I hope this helps you out.

There is one that has appeared in the news group

comp.binaries.atari.st

Its name, IBMFMT, sadly, is the same as another program that has already appeared. The earlier program is IBMFMT.TOS, is the first formatter I found that allowed me to format floppies on my ST that I could use on the PC at the office. I still find it useful.

The most recent program is called "ibmfmt.prg", and it is this one that is designed to format floppies on higher density drives. I have not tried it yet, but I would like to :-).

If there is any doubt, this table may help you to find the right program.

Date Prog name Size Author

1989 July IBMFMT.TOS 3936 Moshe Braner
1990 May ? IBMFMT.TOS 3968 Moshe Braner
1991 July ibmfmt.prg 5760 Y.Tsuji

Who cares?

All *I* am concerned with is how fast the graphics are. Anything apart from
moving rectangles around is faster on the ST than the Amiga. Yeah, the
Amiga is wonderful for arcade games. But I prefer 3D stuff.

NOW FUCK OFF.

> >> since when does the STe have Multi-tasking?

> in C" or some such, don't have it handy since it's in storage.

Oh, Compute books. That would explain it. I bet they didn't use Line-A or
the GEM graphics functions.

NOW FUCK OFF.

> >> hmm are there any companies developing
> >> 16 bit audio boards?
>
> Not from the mail i've been getting.

Well, perhaps if you and the rest of the Amiga fundies would stop sending
each other congratulatory email messages and read a few magazines, you'd
know about AVR / 2 Bit Systems' 16-bit sampling units for the ST.

Although if you want to make music, the Evolution EVS-1 would be much better
with its FM synthesis and PCM rhythm sounds. Programmed from a Desk
Accessory, by the way, so you don't need to quit from your sequencer.

NOW FUCK OFF.

> >Can you read industry-standard 1.44MB floppy disks on those? Either Mac or

Hello Jim,

Turbo C for the Atari ST/TT is no longer supported by Borland. Borland gave up the Atari ST product.
There will be a new version called >Pure C<. The Distributor is Application Systems in Heidelberg, Germany.

Roger.Sheppard@actrix.gen.nz (Roger Sheppard) writes:

>Try to copy Files on A Amiga and format disk, all there commands are external,
>they have to be loaded from disk, that is why they have to use 2 disk drives,

That's a limitation of the real brain-dead old CLI. Most Amiga users have
some different shell to work with. Remember the oooold COMMAND.PRG
early STers used to compile Alcyon C programs? This baby wasn't much
prettier...

>also they only write tracks, not sectors, and with out CRC checking,
>they only do sum checks..

Probably depends on the trackdisk.device and filesystem you're running.

>Also all the Virus problems that they have, you can't write protect
>the disks as they don't use a dive controller ic.

Every modern disk drive I know has a built-in write-protect check.
Even if you fool the Amiga's hardware into thinking a non-protected
disk has been inserted, the drive itself will prevent data from being
written. They have a lot of virus problems, that's true, but that's only
because there are so many A500s around which are solely used for playing
games. Amiga owners who don't run pirated software will be spared.

>There file format is very Slow and there machine runs some 30% slower
>than a ST, this is because of the wait states that they have, no transparent
>video or ram refreshinger.

Again, depends on the installed filesystem. Most Amiga owners run
FFS on their system, and while this is not really a speed dog, it's
bearable. You can also use the FAT filesystem with MS-DOS filesystem
drivers, at least on floppy disks. I don't know if that's possible
with hard disks, too.

30% slower? It is slower in raw computing power, that's true. But you
certainly won't feel a 30% decline in speed when changing to the
Amiga.

> Geez, gimme a break from sob stories.
> BS
A bad joke, really. I couldn't possibly understand why people buy a TT
when they have an ST already unless you desperately need a VME bus or an
ethernet connector. What else are the difference? You couldn't be serious
if you said TT's ran faster or did something better. If your TT has a 19"
monitor and your OS supports the X protocol, then you can say you needed
to buy a TT because your ST could not do that. Or are there software
that run only on TT's? I suppose there may be some, but I wasn't lucky
enough to have heard of any (Most likely something in Deutche Sprache).
We bought our ST because we thought we liked to do something with it and
knew it could. As a loyal ex-Atarian, I cannot stand people who talk as
if we needed to buy an Amiga or a TT to do some word processing, terminal
emulation, etc.
I actually have bought a workstation, but life has been terrible since.
The room has to be cleaned and air conditioned; the system has to be powered
on all the time; the noise of fans are terrible, etc.

Cheers,
Y.T.

>
>

The way UW works is the following (given that everything ftp'ed ok):

1. Run win.prg. You should be presented with one window.
2. Dial in from this window, using the ATDT command.
3. Log into your Unix system, and fire up the server binary.
4. At this point, you can create new windows with the drop down menu entries.

One problem may be that the config file (a text file in there somewhere) defines what size/font the first window is. If these settings have been tampered with, the program may blow up. Send me email if you still have problems, and I will sit down and refresh my memory on the details.

UW for the ST was ported from the Mac, so many of the doc files refer to the Mac. Win.prg (or uw.prg if you are using the euro version) will run on your ST.

1106. TT memory allocation

Newsgroup: comp.sys.atari.st
Date: 1991-07-08 13:19:38 UTC
From: martin@minster.york.ac.uk
Message-ID: <678979177.28538@minster.york.ac.uk>
Source record: 230595
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

The Atari TT has two kinds of main memory, ST compatible ``ST RAM'', and faster, but incompatible ``TT RAM''. The developers' notes describe a new flag to an extended system malloc function to say which kind of memory should be used, and also says that there are two bits in the program header which say which sort of RAM the program should be loaded into, and which sort of memory should be returned by default, by the system malloc functions.

OK so far. My problem is that I can't find anywhere a description of *which bits* in the program header contain this information! If anyone could tell me which bits I should invert to get a program to load, and execute in TT RAM I would be very grateful.

Please mail any answers to me, and I will summarize to the net any solutions.

Many thanks,

Martin

1111. How to "unpack" and "decode"?

Newsgroup: comp.sys.atari.st
Date: 1991-07-08 21:27:36 UTC
From: ag@sics.se
Message-ID: <1991Jul8.212736.13074@sics.se>
Source record: 230588

Hi!

I recently bought an atari 1040 st. There were very little programs
to go with it so now I've got the bright idea to get some nice
programs from comp.binaries.atari or from some archive.
However I don't know how to do that...
I tried some code from comp.atari.binaries tonight with meager
result. I am in a unix environment, I use emacs, I put the
message from comp.atari.binaries in a buffer, kill all lines up
to "tables" and save this in a file. Then I do 'uudecode foo'.
This results in a message that each and every line has got the
checksum wrong. Should some unpacking be done before uudecode?
What I try to do is to change an "article" in
comp.atari.binaries to a program that I can use on my atari!
I imagined that I could change the article to executable (by the atari)
binari-code using unix commands. Then I would dowmload the
file with binari-code to my atari and try the program...
This is stupid?
Could someone direct me to some tutorial on how
to do things like this? I need some step by step manual
(obviously...).

best regards Anders

I don't want to start a war, so I'd appreciate hearing directly from users of either of these programs with their opinions on how reasonable these programs are. I have to document some ST software I've written, and I'd like to use one of these to do it. I've used programs like FrameMaker, PageMaker, Ventura Pujblisher, etc. How do these compare???

I need to do things like the following:

1) Import text and auto-insert pages as necessary

2) Auto-number figures, tables, etc.

3) Create Table of Contents, Index, etc.

4) Import, clip, and change palette of graphics in formats like degas.

I'd appreciate any info anyone could provide. Thanks!

Source record: 230596

No, you misread my post..
Most programs on the ST are powerful enough that they do not need to use multi tasking to get other features...
Sure the St has very well running TSR's which is the main type of programmost amiga people do multi task with day to day...
With the inclusion of Desk accessories I can add specioalized functions if the program doesnt already have them...
I can download in the back ground or upload.. I can run a bbs in the background too.. (Citadel via one of many multi tasking kernals)
The beef is the ST doesnt really NEED multi tasking...
The current features really make multi tasking pretty worthless for most functions.
However if you ever want to use a computer as a multi user system well then niether the ST or the Amiga will work well as is..

Date: 1991-07-09 03:32:43 UTC
From: dcrevier@jarthur.Claremont.EDU
Message-ID: <12273@jarthur.Claremont.EDU>
Source record: 230593
Cross-posted to: comp.sys.atari.st,comp.sys.amiga.advocacy

I have sent a scientific graphing program to atari.archive in the file GPLOT.ARC. It is something that my father and I worked on for the last couple of years. I am a student at Harvey Mudd College, and have used it for many labs and homework assignments. My father is a physicist and has used it for many reports and briefings. We were planning to try to sell it commercially, but have decided to release it as shareware instead since we haven't had any luck finding someone to sell it, and it isn't completely bug free. It is very good for scientific graphing. It will graph sets of x-y data, functions, and differential equations. It has a powerful spreadsheet type editor for entering and manipulating data. It uses GDOS, so the graphs are printed at very high resolution to the printer and look very good. It will work on both color and monochrome monitors. I know that it works with 1040's and Mega's, but it may not work with a TT or a moniterm monitor. Also, I think it needs 1 meg (someone please post once they have tested it). The included documentation is not as thourough as I would like it to be, but it talks about all of the features of the program. It has no information about setting up GDOS. We are asking for a $15 shareware fee. Please distribute this program as much as possible, and send any comments to:

1121. GNU emacs (still can't get it to work)

Newsgroup: comp.sys.atari.st
Date: 1991-07-09 04:39:02 UTC
From: miskinis@aidev.enet.dec.com
Message-ID: <5498@ryn.mro4.dec.com>
Source record: 230599

Hi,

I've received a few mail messages regarding help on getting GNU
emacs to work. I still get the same error "terminal type atari is now
pwerful enough to run..."

I've tried 3 different termcap files, that people have sent me.
I've updated TERM to be the first string in the definition file, (atari,
atari-st, and vt52-emulator respectively), I point TERMCAP to the
device and directory of the termcap file. This has some effect, as
I don't see any "can't find termcap database" errors...

Does anyone have any more advise, or can a pointer to where I
can buy a disk, or copy the files in a working manner?

Many thanks again!

John

1122. Looking for a SCSI hd-formatter ...

Newsgroup: comp.sys.atari.st
Date: 1991-07-09 08:57:47 UTC
From: andre@maestro.htsa.aha.nl
Message-ID: <2987@maestro.htsa.aha.nl>
Source record: 230598

I have an 'old' SH204. In this SH204 there is a an ACSI <--> SCSI converter .... NOW that I have a SCSI disk, I would like to connect it to the ACSI<-->SCSI converter an use it. But, my version of hdx (3.02) won't undersatn (talk to) the SCSI disk......
Is there someone who can help me with a utility, so I can use my SCSI disk...

Thanx in Advance,

Oh yeah. That's why Apple junked their MacOS four years ago and went
into Unix V.4. (Correct me if I'm wrong 8-) Wasn't this pure fun for
all those application programmers? Didn't they make a fortune out of
upgrade fees? Oh, those good old times...

What's so wrong about GEM, Greg? Tell us in detail.

It has been funny--for the most part.

> [Introduction etc. deleted]
>

Ack. Such sweeping generalizations! The word 'enthusiast' implies enthusiasm, excitement and general up-beat attitude toward a particular object, subject or whatever.

I consider myself a computer enthusiast and I have participated in discussions about different machine/software constructions. So I guess I object to being labeled a 'dimwit'.

>
> Furthermore, A computer can not be compared to other computers. As I see it,
> my computers are as dear to me as others pets. You can not compare a dog to a

> construction of electronics, software, and evidently, money. I can never do any
> comparison of my 386 with my Casio fx82 calculator. There are things my 386
> does better, but there are things my Casio can do better as well.

A computer can be compared to other computers. You must have done it in order for you to select your 386. You compared the ST to the 386 and discovered that you could not develop Intel software on your ST.

Your posting smells of political correctness. It seems in our society that if you don't accept everything as "wonderful" you are considered a dimwit, or at the very least uninformed. There are obvisous benefits and disadvantages to every purchase (computer or not) and it is silly to simply say "well it does what I want it too" and not learn from the experience.

The problem is that people are too sensitive. Everyone has to think that _they_ have selected the best. The days of decent technical merit discussions have changed to the days of mine is better than

yours arguments based in marketspeak.

The problem with computers and users today is that they in general
are far too complacent. We don't demand excellence and we don't
get excellence. Don't believe me? Look at Microsoft, they quit
releasing excellent performing software when they released MS/DOS 1.0.

We as a group no longer look at the technical merits, instead we
look at what our neighbor has and decide that if he has a 286 I
must have a 386. I call this Volvo envy. Gone is the time when
people make intelligent decisions based on how a product performs.

There is nothing wrong yelling from the treetops when you have
discovered something wonderful. In this world there is very little
that is truly wonderful. The problem is nobody wants to know what
is "better".

Most folks want to live in their private little worlds and not have
their dreams shattered. It is a shame.

There is something wrong with gloating. That is the crime in these
psstings. Gloating is an exercise of chest-puffing and _is_ a
waste of net bandwidth.

>
> Bringing us to the matter. Comparing non-linear concepts with a linear (our

> Commodore machine'. No way. I just done my job, and enjoyed both of the worlds.
> Why fight? Why bring up such stupid text to a network? Why tire the computers
> for such bullshit?
>

Actually if I had not done these comparisons I would still be using my
Timex Sinclair 1000. To stay competitive in the business of computers
you _must_ know what other people are using and why, because if you
don't you are likely to wake up and find that the world has left you.

That is why I read comp.sys.atari.st and the other newsgroups. I do
not want to be ignorant of what is happening. I can't afford to be.

> The ST is a fine machine. It's great. So is the Amiga. I have many
> complaints for Atari themselves, by not supporting their machine, but I have no
> problems whatsoever with the machine itself. As a package, enclosed with a very
> resonable price, the ST is a winner.

No comparisons! Your statement should read if you wish to maintian your
political correctness "The ST is a machine. It exists. So does the
Amiga". That way you don't offend anyone.

See this is the problem with the world. It is just like gun control,
instead of controlling the people who mis-use guns the solution is to
get rid of the guns. See the point?

>
>[Lots of comparisons and marketing thoughts deleted]
>

> mud fight in the sewer. Tom, Peter, enjoy your machines. I'll enjoy mine too.
> Behave yourself dudes, grow up. Or otherwise, steer clear from computer life.
> It is not for you.

Let us get the current crap off of the net. I would enjoy a factual
comparison between computers. What Thomas Hill did was wrong, as it
smelled like the kind of help FortWorth-less Jim (Ex-Speaker of the
House) would offer "We...we only wannna help you.."

Yes, I am an Amiga owner. No doubt you figured it out. I also
have owned a c64, Timex 1000, Sanyo MBC-555, Atari ST, 286 and several
Amigas. I enjoy computers but I am never silly enough not to understand
the mistakes in purchases I have made as well as the "excellent"
selections I have made.

If every machine was perfect wouldn't Microsoft have given it to you??

1127. Multi Lingual Word Processor

Newsgroup: comp.sys.atari.st
Date: 1991-07-09 15:06:23 UTC
From: frankh@hpnmdla.sr.hp.com
Message-ID: <810026@hpnmdla.sr.hp.com>
Source record: 230462

My uncle is looking for a multi lingual word processor for printing both English and Greek. He was shown a program called "Power Writer and Multi Lingual Word Processor." This program was run on an Atari ST computer, but they had no documentation. He was able to get the following information:

The program was written by
Power Systems
13406 NE 84 ST.
Redman, Washington
206 888-3730
It was designed by Drew H. and was REV 1.4.

My uncle has written to the above address, and called the phone number. I also called information in Redman to try and find another phone number. We have not been able to contact this company.

Does anyone know how to contact this company? Does anyone have a copy of the program they would be willing to sell? Does anyone know if this program has been set up to run on an IBM compatible?

Any help you can give us would be appreciated.

Thanks
Frank Hamlin

You can't guarantee any Hard Drives with the DMA bug, get the DMA IC
replaced.
In this country we have a sales of goods act, this meens that the product
must not be faulty for its nominal fault free life, if it is, they must
fix it free of charge.

Note, this is a manufactures fault and sould be replaced at no charge
to you, its Ataries fault not yours.

> Howv much does a LaserWriter IIntx cost? What kind of technology had Steve
> Job chosen on his NeXT Laser printer?

Amusingly, the NeXT printer is very reminiscent of the the Atari Lazer
printer. It uses the Cube's display Postscript to image a page at 300
or 400 dpi and then spews it out though a fast connection to the Laser
to print. Exactly what an ST does when using Ultra Script.

martin@minster.york.ac.uk writes:
>OK so far. My problem is that I can't find anywhere a description of
>*which bits* in the program header contain this information! [about
>allowing program load and malloc to come from TT RAM]

I think it's there somewhere, but it's easier to answer this than find
it myself and tell you where to look.

One of the previously-unused longwords in the program header has been
assigned a meaning as of TOS 1.4. The least significant bit of this
longword is a flag which, when set, says "don't bother to clear the whole
TPA, just my declared BSS." The next-least significant bit declares that
the program may be loaded into alternative RAM (that is, non-ST RAM) and
the next bit declares that alternative RAM is eligible to satisfy Malloc
calls. The high byte of the longword has another meaning (too arcane to go
into here) and the other bits are reserved.

This longword is at offset $16 from the start of the program file. Thus,
the program header looks like this:

```
struct prg_header {
short magic; /* always $601a */
long tsize, dsize, bsize, ssize; /* segment sizes */
long unused; /* unused */
long prgflags; /* described above */
short absflag; /* if nonzero then no fixups */
}
```

I think program appeared recently in c.[sb].a.st which lets you set the
bits in prgflags.

```

>Calamus?
>
>PageStream?
>
>HAHAHAHAHAHAHAHAHHA.

:-)

>
>Your joking right?

Well, I have seen both of these programs. Calamus is by FAR a superior product, no ifs ands or buts.

The only reason, however, I could see for buying an ST for DTP is a severely tight budget. A Mac Classic or Mac LC with Pagemaker costs a little more, but provides superior results. For anyone who has serious DTP work to do, I don't think I could recommend the Atari. For casual DTP use, an ST with Calamus is a nice cheaper alternative, though not significantly cheaper (I think the price of the software will make the biggest difference).

Cheers,

Chris (mellowing with age) Mauritz

>suppose that those atari printers aren't postscript either. have you used a
>laserwrite IISC (scsi laser printer). scsi is alot faster than appletalk, yet
>they print at the same speed.

Yes, I think that fast Post. Printers CAN keep up, if not surpass,
appletalk speeds (max 250k bps). The reason a LWIISC prints as slow as
say the IIntx (which I doubt but I shall hold my tounge as other conditions may
be present to cause the IIntx to slow down) is that the IISC uses a 68k
processor while the IIntx uses a 68020 (but uses appletalk). The IISC
doesn't have the speed to take better advantage of the SCSI connection. The
new laser printers that will be released October use 25MHz '030 and ethernet
connectable - those should be pushing the limit of the laser-printing speeds!
Does the Atari laser printers use anykind of CPU for image fetching?
Also, is the image bit for bit what is printed? If so, why is it so hard to
make it postscript-usable?

Rod.Fulk@f24.n228.z1.FidoNet.Org (Rod Fulk) writes:
>Most programs on the ST are powerful enough that they do not need to use
>multi tasking to get other features...

That's a matter of opinion. What you end up with is a bunch of programs
doing similar things (like file dialog boxes) in different ways, resulting
in a non-uniform user interface from one application to the next.

>Sure the St has very well running TSR's which is the main type of programmost
>amiga people do multi task with day to day...

Amigas do not use TSRs. A TSR is either running, or waiting. TSRs don't
run concurrently with anything else.

>I can download in the back ground or upload.. I can run a bbs in the
>background too.. (Citadel via one of many multi tasking kernals)
>The beef is the ST doesnt really NEED multi tasking...

Background file transfers do not need multitasking. You can't, however,
play a game while calculating a raytraced picture, edit a source file
while compiling another entire application, or play music while compiling
a program AND editing another AND downloading something else in the
background. You need multitasking for that. Once you have it, you don't
want to do without.

>The current features really make multi tasking pretty worthless for most
>functions.

Try it out first.

>However if you ever want to use a computer as a multi user system well then
>niether the ST or the Amiga will work well as is..

Unless you're running unix on the Amiga.

1140. XControl Maccel

Newsgroup: comp.sys.atari.st
Date: 1991-07-10 01:17:57 UTC
From: selick@bucsf.bu.edu
Message-ID: <85538@bu.edu>
Source record: 230470

I received XCONTROL.ARC from Terminator, and at first got a comlete system hangup. After gradually adding .xpc files to the directory xpc, I found that the problem was the maccel file. Is it my 1040ste with tos 1.6?

1141. Author(s) of Alchimie Jr. - A Midi Sequencer

Newsgroup: comp.sys.atari.st
Date: 1991-07-10 02:55:16 UTC
From: umhagma1@ccu.umanitoba.ca
Message-ID: <1991Jul10.025516.1693@ccu.umanitoba.ca>
Source record: 230412

First of all, I must say that this is one heck of a sequencer. I would really like to get a hold of these pseudo-geniuses to congratulate them and also ask a few questions. It doesn't seem that they have an internet address that I could get a hold of them at, so if anyone knows who these people are and how I could get a hold of them it would be extremely appreciated.

I noticed that they have 4 places that you can get a hold of them at:
by mail, (to Switzerland, and I am in Canada);
or through one of the following (all of which I don't have access to, I don't think):
COMPUSERVE ID 100016,156
BIX ID DCANEVESI
DELPHY ID DCANEVESI

(ALCHIMIE Jr, copyright (c) 1989,1990 Prosoft Informatique.)

Any help would put me in thorough blissfulness. Please help me soon.

Thanks in advance.

>Steve Shawl

I'd agree, if it wasn't that both IBM and Apple have a big stake in nothing coming directly out of this agreement. IBM wants to be sure Apple doesn't put them through endless lawsuits when they move into GUIs. Apple wants to be able to get into more offices. But neither one wants to develop a product that the other one has something VERY compatible with. And by the time anything comes of the cooperation, we'll be into another generation of machines, at least.

I still say Atari has the machines on the shelf to make itself a future. They NEED to grind them out in big numbers, and at a decent price. Do that, and everything else gets better. Don't do that, things get worse. What Apple and IBM do a couple years down the road is a problem to look at later.
Steve

1144. 1.44M upgrading (help)

Newsgroup: comp.sys.atari.st
Date: 1991-07-10 05:38:36 UTC
From: yonder@netcom.COM
Message-ID: <1991Jul10.053836.6974@netcom.COM>
Source record: 230465

Well, as you may have guessed, I am trying to get a 1.44m drive working in my ST (1040STf). Anyways, my first bummer was that I found I had the old WD1772 IC, so I purchased a 02-02 version. I came home and desoldered the old 1772 and then soldered in a socket. I put it all back together (plugged the old 1772 in) and everthing still worked... So far so good. I then tested the new 1772. It works ok... Now for the good (bad) stuff...

The 1.44M upgrade document says to run 16Mhz to the 1772 pin#18 from pin #39 of the video shifter (U31). So I installed the new 1772 in the socket with pin #18 bent up. I used a small set of test clips to connect pin #39 of the shifter to the bent up pin. Well, everything booted up fine still (from harddrive). All accesses to the floppy drive failed now though. So I moved on to the next step. The docs said to set the step-rate to 6ms (vs. normal 3) to offset the doubled clock speed. I have TOS 1.0. The docs said to set the clock rate from Gulam like so: 'pokew a08 3' for 3ms and 'pokew a08 0' for 6ms. This seems kinda weird, like it would be more intuitive to do store a 6 for 6ms... Anyways I stored the 0 at a08 and then ran the IBMFMT.PRG (of Y.Tsuji) as suggested in the docs. It just locked up when it tried to format the disk.

My questions: Am I doing anything obiously wrong? Have I set the step rate correctly? Are the pin numbers correct? Is there another place I can pick up the 16Mhz? Should I go with a 16MHz osc (uhg)? Is there a better way to test this?

Oh yah, I'm usng the TEAC 235HF drive (which works beautifully as a 720K). Do I need to set the straps differently for 1.44M operation?

After I determine that I can get this to work at all, I plan to setup one of the more complete HD circuits, probably using a '157 and the HD line from the drive to select and appropriate clock rate...

Thanks...

1145. Supra vs. ICD controllers

Newsgroup: comp.sys.atari.st
Date: 1991-07-10 06:04:03 UTC
From: yonder@netcom.COM
Message-ID: <1991Jul10.060403.8376@netcom.COM>
Source record: 230469

I'm about to emabark on the fun project of setting up a homebrew harddrive system for my ST (SyQuest 44). Anyways, lots of folks have suggested the ICD Advantage adapters. ICD's seem to be reliable, have good tech support and very good software. Supra adapters can be gotten for less though. The Supra adapters have everything the ICD has as far as basic features. Both have clocks. Are the ICD adapters worth the extra money. Should I avoid Supra? I haven't heard anything good or bad about the Supra controllers. BTW, I'm going by what I have seen in my new BEST Electronics catalog:

ICD Advantage w/clock --- $105.95
"The New" Supra w/clock - $ 77.00

Both seem to come with software, cables, etc. Anybody know what the significance of "The New" is above. Was there an "old" Supra adapter? Can anybody comment on Supra's support, reliability? How about will a Supra work with a SyQuest (obviously very important).

>
The older ST Roms don't work with a 68010 because of some problems with how it calls routines (using traps instead of simple JSRs), and the 68010 has a different stack frame which mucks it up. On the Amiga you can do 16Mhz because there conveniently is a 28Mhz clock you can pull and divide down to 14.32Mhz. Don't know if there is a tappable 16Mhz clock on the ST somewhere however.

Benefits: Flexibility, you can remove whatever cmds you don't need and add
others, plus they don't occupy space on the memory map (ROM space)

>they have to be loaded from disk, that is why they have to use 2 disk drives,
>
Drawback: yep, 2 disks are almost necessary for ease of use.

also they only write tracks, not sectors, and with out CRC checking,
>they only do sum checks..
>
You can write to sectors all you want, just the OS writes/reads entire tracks, DMA stuff...

B
Also all the Virus problems that they have, you can't write protect
>the disks as they don't use a dive controller ic.
>

There are ways to avoid viruses, bootblock viruses are the least of ones worrys considering all the smarter viruses. Some bootblock generators are virus hunter/killers.
The chip is a drive controller, its just in a custom chip that
also happens have in it the sound DMA, D/A converters and so on.

There file format is very Slow and there machine runs some 30% slower

Can't quarrel with you on that, AmigaDos is slower than ST/IBM format, no
question about that.

>than a ST, this is because of the wait states that they have, no transparent
>video or ram refreshinger.
>
Speed is comparable, and much faster if there is heavy use of graphics & sound

Video is handled by the video chips, not the CPU, RAM refresh is handled by them as well.
The CPU has better things to do than 'blit' blocks on a screen.

I know I had one, all it was good for was Games.?
>
Yep, darn best gaming machine around today. Its also a neato computer too.

No I'm not kidding! This months ST 'Luser' had a small article about how Atari attended the Corporate Electronic Publishing Systems Show in Chicago.

Linotype were so impressed with the Atari TT when connected to their hardware that they intend to have the TT on their stand at such events in the future.

The article mused that Atari US Marketing Chief Alwin Stumpf (formerly Atari Germany) was probably responsible for this move. Way to go Alwin!

So Atari can do things right when they want to.
BTW: Atari US, can we borrow Alwin in the UK for a while?

I have been asked by M.Bouron@uk.cray.com (Marc Bouron) to post this for him.

I am having a few problems now that I've downloaded FATSPEED. I cannot write to any HD partitions ("disk full"!!) and `show information' eventually crashes with four bombs (illegal instruction). Delete and rename work fine :-|

I have NeoDesk 2.06 running over TOS 1.0 -- does anyone know any problem with such a configuration? I have stripped out my AUTO folder, so I am just running ICDBOOT.SYS, FATSPEED.PRG, and STARTGEM.PRG -- this had no effect...

As ever, thanks for any and all information :-)

Cheers,

[M][a][r][c]

Message-ID: <9107101744.AA28213@ucbvax.berkeley.edu>
Source record: 230483

I can only see cosmetic differences between these two versions of trak_ste, and the same probably applies to trak_st. There was a new "step" feature but heaven only knows what it does. So what's the difference?

I thought that at least the sample length bug would have been fixed, but no dice. (The maximum length of a sample with trakste is 8000 while other trackers permit FFFF).

>However if you ever want to use a computer as a multi user system well then
>niether the ST or the Amiga will work well as is..

I agree that it is possible to force the ST to multitask by using third party software, though I have yet to see any of these systems multitask gracefully, with the exception of Beckemeyer's shell. The trouble is that since all of these solutions are basically third party hacks, there is no standard and therefore only a handful of ST programs are written to take advantage of them. With the Amiga, and any other "turn key" multitasking system for that matter, the multitasking is built right into the OS. This way, all developers know about and can take advantage of multitasking in all programs if they wish. Also, with the ST you have to buy a lot of third party stuff to get this type of multitasking ability whereas machines that were designed to multitask already do it without any additional investment on your part.

Is multitasking a good thing to have? You bet! I never realized what I was missing with my ST until I started using Multifinder (though this isn't true multitasking) and later a Sparcstation. After using a multitasking machine for a while, you will wonder how you ever got along without it.

Cheers,

Chris

1156. Re: Lattice C Assembly Lang.

Newsgroup: comp.sys.atari.st
Date: 1991-07-10 14:37:45 UTC
From: David.Black@newcastle.ac.uk
Message-ID: <1991Jul10.143745.2933@newcastle.ac.uk>
Source record: 230479

I have been using Lattice C for a couple of years now. Originally in it's metacomco incarnation and then in it's HISOFT version. I have written several largish programs under the HISOFT version two of which included 68000 assembly language routines.

I can't say that I ever had any problems intergrating the assembly language with the C. HISOFTS CSET directive is simply a vehicle by which the program, data and uninitialised data sections of a C program can be accessed from assembly language.

The only problems which I did find with the CSET directive is that it can be too strict. The assembler will not allow mixed instruction and data values with in the main code section. This problem caused particular problems when I was attempting to compile the ST MINIX sources which use this schema to em-bed the jump vectors within the boot sector code. However reverting back to Devpac and assembling to a GST format object module solved that problem.

On the whole I have found Lattice C to be one of the best developement environments which I have seen on the ST. The linker is as fast as I have ever seen, it's just a shame that the compiler is slightly on the slow side!.

1157. trakst2.prg - colour only??

Newsgroup: comp.sys.atari.st

How about a program that installs the 8x8 font as being the standard
GEM font for titles and verbatim (non-icon) directory listings for
monochrome monitors. I really do not appreciate the 8x16 fonts.

Is this possible? Hope so!

Got a Mega 4 ST. Wishing it was a Mega STe! :-| Do I *really* want a TT? ;~#

1161. what I think about GEM

Newsgroup: comp.sys.atari.st
Date: 1991-07-10 18:31:14 UTC
From: CSULLOGG@CRL.AECL.CA
Message-ID: <31210@know.pws.bull.com>
Source record: 230298

Repeatedly, someone crabs about GEM. I agree that the various ST releases of TOS 1/GEM are limited. However, I find that versions 2 and 3 are very good. I am hoping that the CPX implementation will take on the flavour of the Mac system folder approach (especially combined with FSM).

WINDOWS looks great but, compared to GEM or the Mac OS, it is quite clumsy. If you want to copy a file, you have to run the File Manager, find the file you want to copy and then TYPE out the destination INCLUDING pathways! Yikes, gimme a break. The best thing about WINDOWS is WINDOWS applications, NOT WINDOWS itself. Even that has to be qualified. Try using Corel Draw on a 25 MHz 386SX, like the Compaqs we have. I just do not have the patience to wait so long for screen updates. An 8MHz ST running Calamus and Outline Art makes Corel Draw look like a kiddie application in both speed and elegance!

I am a die hard Atari enthusiast but the Mac OS is still the most elegant OS I have ever used. I cannot speak for GUIs under UNIX (like MOTIF) because I do not have a system that can take it (I am writing on a 4 meg TT with a 50 meg drive; from what I am told to use UNIX/MOTIF comfortably I need 8 megs of RAM and a 120 meg drive).

This is not the start of a FLAME war nor the ravings of a pro ST lunatic. In my opnion, and that's all it is, MY OPINION, GEM, especially version 3, is very good. I suspect that those who say GEM is brain dead are referring to the truly brain dead version on the PC.

I'll repeat something I said on the NET before. I wish I could see an Amiga in action. Locally (town of 4000), there are > 150 STs and TTs and only a handful of Amigas (I know of 4). I'd like to see the OS for myself and to see the types of applications available. Why, because I am not narrow minded enough to write off another computer just because I do not own one (one exception is VMS based systems; when I said I was writing on a TT what I really should have said was that I was writing on a VAX station using STalker on a TT).

> I noticed that they have 4 places that you can get a hold of them at:
> by mail, (to Switzerland, and I am in Canada);
> or through one of the following (all of which I don't have access to, I don't
> think):
> COMPUSERVE ID 100016,156
> BIX ID DCANEVESI
> DELPHY ID DCANEVESI

That CompuServe address looks fishy (most of them start with a 7, not a 1)
but you should be able to send email to any CompuServe subscriber by following
these rules:

* Change the comma in the user ID to a period.
* Add @compuserve.com

This method should work from any Internet site and any UUCP site running
a reasonably non-brain-damaged mailer.

CIS subscribers can send mail to Internet and other domain-addressed sites
by addressing it to:

>INTERNET: user@site.domain

... where, of course, user@site.domain == your address.

BIX and DELPHI are not at this time reachable from the real world.
Neither is GEnie (but they're working on it).

The arc update routine (-u switch) in Dcopy3.6 is buggy -- it
consistently corrupts archives. Is there a newer version of Dcopy
that fixes this problem (or even an older version that works)? Or
does anyone have another *fast* arc updater? Thanx,
BBB

Who knows? It might have a beneficial effect in that it might force Atari
to give up the ridiculous idea of making workstations and concentrate on
what it is good at, making games machines and little gadgets.

Cheers,

Chris

1165. Info about PD ST Midi Sequencers and DX librarians ?

Newsgroup: comp.sys.atari.st
Date: 1991-07-10 20:12:08 UTC
From: colm@wsl.ie
Message-ID: <808@wsl.ie>
Source record: 230491

I've an Atari ST, a Yamaha DX11, and a MIDI cable and I'd like to get them together in a meaningful way! If you know where I can get hold of

(a) a PD/ShareWare/cheap seqencer program
(b) a ditto DX voice librarian

please reply by e-mail.

I'm especially interested in programs that work on a monochrome monitor as my colour monitor is recently deceased.

If I receive any requests to summarise, I'll do so using the same medium (posting or e-mail).

Thanks!

Just saw the compter chronicles about CD-ROM today and in their computer news they mentioned the Apple-IBM talk. According to them the talk has slowed down due to each side not quit trust the orther side. And what Apple is trying to get the RISC chip tech. from IBM and IBM is interested in Apple's GUI and software ablility. So it's more likely be the hihg end machine rather the home computer, plus they have a lot to overcome on each other before hte whole thing become relatity.
It does not looks a deadth wish for ATARI, plus ATARI should not seat still any way. Competition brings stimulation to progress. Look what workstation market has been in the past year, NeXT, HP700 series has push the workstation to greater strength for less cost.
Just my personal view.

Probably. How about a mondo-program combining all of the little tiny
ones (w/user defaults). That would be cute, eh?

Are there any PD programs to install low/medium rez fonts and a supply
for them? The Turbo-C editor has it's own fonts and is a pleasure to
use on a color system. I'd like to do this with uEmacs and other
programs...

Thanx.

I'm a C newbie and am having a little trouble working with GEM. Is there a standard way of dealing with GEM objects? Beyond "objc_change," I mean -- I'll need to edit flags and such. I've fiddled with a few ways, none of which seem very elegant. Could someone post some code that will show how to load up a random number of trees and edit any particular attribute of any of those trees?

Thanks...

1175. New stuff at atari.archive.umich.edu

Ok folks, there's alot of new stuff on it's way in. Big thanks to e
everyone who's uploaded something or sent in some index updates.
I'll buy you a beer, now that I can :).

Here's something that Michal wanted me to post for him regarding his
recent upload:

A new version (1.4) of szadb debugger is available from atari.archive.
Executables, sources and documentation. For those who are unfamiliar
with it - this is a low level ST debugger patterned after Un*x adb.
szadb keeps debugger and program screens separate thus allowing for a
sane debugging of GEM programs. It also understands symbol tables
from many compilers. Even if your particular one is not on the list -
you may easily add it yourself.

The new version adds a support for "long" 22-character symbols
optionally produced by recent versions of gcc loader. It also can be
run not only on ST but also in all resolutions on TT automagically
adjusting itself to the current display parameters.

Happy and productive debugging,
Michal

I'd like to see a DC program that allows the same keyboard window handling that Gemini uses work with applications. Control D to close control W to rotate through, etc. If you can do DC Topper, then this should be possible.
Does DC Topper work with Gemini yet?

Oh yea?
Since when?
GEM is a very powerful system...
Especially in the world of the TT... Works nicely...
I understand the TT's don't even need to reboot to change the 5 color resolutions..
And the Mega Ste's are really nice too..
I would rank the OS's for power and ease of use in the following order...
(For older systems.. The NEWER Systems dont really count cause they are for newer machines... Nor have i played with them all.. Note: ALL the computers I mention have better OS's out and I will put a () notation beside these with the current OS that I know about...)
From best to worst from a users point of view...
Mac 6.0.5 (7.0!?)
Atari Tos 1.6 (3.x!?)
Amigados 1.3 (2.x!?)
Msdos 3.3 [sic] (5.0!?)

Note, In my humble opinion ANY of the OS's in the ()'s will beat all the others NOT in brackets... Rating the ones in the brackets is a whole new ball of wax with new rules etc.. ;-)

Ands the ratings I gave are based on no accelerators whatsoever...
The ONLY thing allowed are bug fixes...
However the Mac/Ibm/Amiga (In that order) loose a little since they are mainly disk based in most systems.. (All the systems have an extensive amount of OS in ROM but have some major portions in ram too.. However I am not sure abouy some amigas.. I understand Kickstart is in the ROMS on some machines...)

>cost. I'm still going to keep looking for other sources, but this is it so far.

If anyone else is interested, I was just told of another source, a company called FAST Technology, based in Massachuetts. (Sorry I don't have their address/ph# handy right now.) At any rate, they are said to sell an adapter for a mere $45. A pittance compared to the $240 charged above.

FYI, the $240 adapter consists of a PLCC "plug," which is basically a squarish block about 3/4" high, with gold contacts for the PLCC socket. This is on the underside of a piece of PC board. This board is attached to a second board by two rows of about 3/8" high pins/standoffs. On the second board is a standard DIP socket (64 pins) as well as 2 rows of additional leads pointing in parallel with the PC board surface (for attaching test equipment). It's somewhat impractical for my needs, since I wanted something very compact for inserting a replacement CPU...

1183. Zoo 2.1 - first impressions

Newsgroup: comp.sys.atari.st
Date: 1991-07-11 07:22:48 UTC
From: klute@tommy.informatik.uni-dortmund.de
Message-ID: <3624@laura.UUCP>
Source record: 230406
Cross-posted to: alt.sources.d,comp.sys.atari.st

I just installed the new zoo version 2.1 on my Sun SPARCstation. To get a first (non-representative) impression of its compression rate and speed I packed everything in the zoo installation directory (including objects and binaries) into a zoo archive using the new zoo and specifying the new option 'h' to get higher compression. Then I did the same with zoo 2.01, arc 5.21 and with that LHarc that identifies itself with "LHarc for UNIX V1.02 Copyright(C) 1989 Y.Tagawa, special Amiga option by S. Becker".

Here are the results:

```
Archiver: Comp. rate: Comp. time:
-------------------------------------
zoo 2.1 61% 28.6s
zoo 2.01 49% 13.0s
arc 5.21 48% 17.1s
lharc 41.5% 35.4s
```

I think with zoo 2.1 we have a very decent archiving system that not only gives a great flexibility and a lot of possibility no other archiver offers, but now also has the advantage of a very good compression rate. It rules out LHarc in that respect - at least regarding my non-representative data. Therefore here goes a big "thank you" to Rahul Dhesi!

However, there are two subjects that could be improved:

Although the old zoo 2.01 is available for the Atari ST, I couldn't find ST specific support in the Makefile.

The ST version lets you do something like 'zoo a// archive.zoo *'. The '//' in conjunction with the 'a' adds not only simple files but also directory trees to the archive. I would like to see that as a general feature in zoo.

From what I've heard, the only ST QL emulator so far (unless Tony Tebby's managed to get his QDOS compatable OS on the market) is the hardware/software emulator from some german company, and I don't even know if that exists any more. (The last QL World I got was March last year).

I hope that helps. Sorry I couldn't help you further (us QL owners have to stick together).

1185. Zoo 2.1 - second impressions

Newsgroup: comp.sys.atari.st
Date: 1991-07-11 08:52:01 UTC
From: klute@tommy.informatik.uni-dortmund.de
Message-ID: <3625@laura.UUCP>
Source record: 230409
Cross-posted to: alt.sources.d,comp.sys.atari.st

```
One more note on the compression rate: When I archived the zoo 2.1 sources
with tar I got the file
zoo-2.1.tar (647168 bytes)
After compress:
zoo-2.1.tar.Z (245339 bytes)
Then I packed everything into a zoo archive:
zoo-2.1.zoo (208253 bytes)
Nice, isn't it?

And one more flaw: Unfortunately the old time zone bug is in zoo 2.1 again!
What happens is as follows:

I want to archive a file 'file' (note date and time):
-rw------- 1 klute irb 4672 Jul 11 10:44 file

Then I run zoo to archive the file:
zoo ah archive.zoo file

Looking at the archive contents (note date and time):
zoo l archive.zoo
Archive archive.zoo:
Length CF Size Now Date Time
-------- --- -------- --------- --------
4672 63% 1744 11 Jul 91 10:44:46+64 file
-------- --- -------- --------- --------
4672 63% 1744 1 file

After extraction
zoo xOS archive.zoo

my file has a date and time somewhere in the future:
-rw------- 1 klute irb 4672 Jul 13 1991 file

My time zone is Middle European Time (MET) which is one resp. two hours
ahead of GMT.

Rainer> The ST version lets you do something like 'zoo a// archive.zoo
Rainer> *'. The '//' in conjunction with the 'a' adds not only simple
Rainer> files but also directory trees to the archive. I would like to
Rainer> see that as a general feature in zoo.

Hear hear! I would love to be able to say 'zoo [magicoption] dir_name'
and have the whole directory structure archived, like tar. Using find
and the zoo 'I' option is clumsy.

Wish #2 (related to above): a Unix-specific option to also archive
directories (also empty ones!) and (hard/symbolic) links would be a
big plus. For now, if you want an exact copy of a directory structure
you have to use tar. Unpacking these on non-Unix platforms could be
done by automatically dereferencing the links while unpacking.

About the same as the Next - IBM agreement. Nothing.

Just seems to me that IBM wants to LOOK at what everyone else is doing, but
I have yet to see anthing come out of it. The last thing that I remember
coming out of one of these agreements is OS/2. 'Nuff said.

I think they are refering to Ataries mouse utill 3, don't have
the correct file name as I trash it, because it was causing a few
problem with some programs, Dcshow 1.1 was getting damaged,
so I use another mouse utill, I have seen other comments about this
program being buggy..

Hi John!

Let me first say that we are very glad to be getting the great feedback on the net to our programs! Please, everyone keep it coming.

8x8 font installer - Several programs exist on the market to replace the fonts used, including one on the CodeHead's Utils disk called FontTrix. I know several PD ones are available where you can choose the font you want. Is the idea to also get double the listing in windows, or do you just want to replace the font. The former would be tricky, the latter easy.

As for keyboard handling of windows, just keep an eye out, it is already being worked on. Personally, I've only booted Gemini to look at it, so I'm not familiar with its keyboard operations, but I know what you are talking about.

Version 1.2 of DC Topper does indeed work very well with Gemini and NeoDesk and within programs. V1.2 does not generate button clicks, so it will not 'click' a dialog box, file selector, menu entry, etc. by accident when you go over an inactive window.

Please, keep the ideas rolling!

You need a copy of MACCEL3 in your AUTO folder. Unfortunately this doesn't
yet appear to have been made available to non STE and TT purchasers.

No comment about a Mac LC, but I'd have second (and third, and....) thoughts before undertaking DTP on a Mac classic. Something about small, moderate-resolution screen and limited RAM.

I've used Pagestream for some small, intricate stuff, and it works very well for that. I believe the question concerned jobs on the order of magazine production, and the obvious place to ask would be around Current Notes and AIM. I believe they're both done with Calamus now, but DON'T take my word.

If Chris is really mellowing with age, more power to him.

Tried to e-mail, but the reply failed. Anyway...

You should put them in a folder called A:\skates.jmw NOT A:\skates\jmw

I've already erased this one (anything that won't run off the hard drive
had better be really good), but different strokes for different folks.

Good luck.

Let me make a little correction:
D. & J. Geiss -as told to me by an ADI developer- did the migration
from Adimens V1.6 to Adimens V2.1, they added a GEM Surface (and
debugged the rest...). Having finished their studies they left ADI Karlsruhe
to join BASF Ludwigshafen. Now they work as they told me on Atari Messe
last year with GUI on several machines (Mac, VAX, Atari I don't know...).

Packing all experiences they made with Adimens (including it's disadvantages)
they developped PHOENIX database: Believe me - this beast is

Things like these are best made using TeX. OK, you can't use TeX in
WYSIWYG, but you don't have to. TeX (In this case either CS-TeX or
Stefan Lindner's version) does all what you need and produces even
great looking output.

Everybody who has to write stuff like this, should take a look at one
of the real good TeX-implementations on the ATARI.

Presumably you are referring to "maccel3.prg". I have been using it
but still got the message from xcontrol that it wasn't installed. I
changed my boot sequence so that "maccel3.prg" is the LAST thing
loaded from the auto folder and now everything seems to work fine. I
don't know which program in my boot sequence was causing the problem.
Does xcontrol locate maccel3 using the cookie jar, or does it use some
other hack?

Hello,

I just got NCS_DEMO from atari.archive last night and I was very impressed. However I'd like to talk to someone who has actually used in for pixel recognition (ie. handwriting and that sort of thing). The system says it can handle that sort of thing but they don't show it off in the demo. Actually I'd be interested in talking to anyone who has used the actual NCS software.

From: koreth@twitterpater.eng.sun.com
Message-ID: <1507@grapevine.EBay.Sun.COM>
Source record: 230433

Zoo 2.1 is pretty impressive, all right. As soon as someone submits a working ST version to both the sources and binaries groups, I'll start accepting submissions in zoo 2.1 format. It'll be nice to get away from the lharc controversy once and for all. (I have no special attachment to the program, as some have claimed; it just gave the best compression at the time.)

My results, on a directory with sources, SPARC executables, and object code:

```

1209. Racter: Is there a ST equivalent anywhere?

Newsgroup: comp.sys.atari.st
Date: 1991-07-11 21:17:03 UTC
From: mwtilden@watmath.waterloo.edu
Message-ID: <1991Jul11.211703.20581@watmath.waterloo.edu>
Source record: 230435

C.M.Borges' limerick program reminded me...

An old Scientific American article once discribed a program called
'Racter' which was a nonsensical syntax generator. It could
form perfectly correct grammatical sentences but of often
hilarious content. So good that it was used to generate the
book 'the policemans beard is half-constructed'.

Is there a similar one for the ST anywhere?

Is all.

> doing similar things (like file dialog boxes) in different ways, resulting
> in a non-uniform user interface from one application to the next.

Let's see... a bunch of programs doing file dialogue boxes in different
ways... Which computer does *THAT* sound like?

Which out of the ST and Amiga has had a standard file selector built in to
the OS from day one? I'll give you a clue -- it's not the Amiga.

> Amigas do not use TSRs. A TSR is either running, or waiting. TSRs don't
> run concurrently with anything else.

The Amiga's processes don't run concurrently with anything else. The Amiga
only has one CPU. It spends a bit of time running one process, then jumps
to another, then the next...

Whereas the ST spends a little time running the main application, then jumps
to the first TSR, then the next...

Spot the similarity?

> >However if you ever want to use a computer as a multi user system well then
> >niether the ST or the Amiga will work well as is..
>
> Unless you're running unix on the Amiga.

Or the ST/TT.

1212. Hard Disks and the STE

Newsgroup: comp.sys.atari.st
Date: 1991-07-11 23:19:57 UTC
From: tensmekl@infonode.ingr.com
Message-ID: <1991Jul11.231957.4319@infonode.ingr.com>
Source record: 230438

When I bought (and finally received) my 1040 STE, I had major problems accessing information on my Supra HD. The dealer replaced my machine and some of the problems went away.

Some of the problems remained, (Arc.ttp (or any executible) executed from any drive, would lock up the system.

These problems, do not exist when used with the 1040ST.

In desperation I called the Supra tech support line (503 967 9081) (9-4 pst). It was an interesting conversation. After identifing my hard drive, and the target system as a 1040. He wanted to know if it was a ST or a STE. I told that the ST worked and the STE didn't and he asked me what version of the Supra software I had. I told him 3.02. He told me that the current version was 4.26. He got my name and address and told me that a new disk would be in todays mail.

My next disk will probably come from Supra.

I feel good about Atari computers again. I will most likely order more software from the dealer who replaced my computer.

1215. Lattice C

Newsgroup: comp.sys.atari.st
Date: 1991-07-11 23:33:35 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1991Jul11.233335.8445@lsuc.on.ca>
Source record: 230443

I have just received word that there is a 2nd edition manual that
is coming with newer versions of Lattice C version 5 that has better
documentation on assembly language. My manual is the 1st edition, dated
March 1990. People buying the very latest packages should be getting
the new manual.

But this raises the problem about updating the manuals. The
manuals are NOT the usual 3 ring binder type which one would expect
for compilers (which are prone to errors in the manuals) but rather
a set of wire-bounded books which makes it difficult to change pages.
The errata material in the "readme" disk file is getting a bit lengthy.
I'm wondering now what the policy is going to be regarding buying the
new manuals. It certainly would be cheaper if they could send out
loose-leaf updates when you send for compiler upgrades.

Anyway, I'm already stuck trying to port my program from Sozobon C
to Lattice C. The compiler seems fussier than I like. Still, assuming
I haven't hit a compiler glitch, I suppose it will result in better
code in the long run.

1217. Pagestream 2.01 Shipping!

Newsgroup: comp.sys.atari.st
Date: 1991-07-11 23:42:18 UTC
From: twmanino@taco.cc
Message-ID: <1991Jul11.234218.16726@ncsu.edu>
Source record: 230437

In case anyone is interested...

I requested the update to Pagestream 1.82 -> 2.01, and I finally received it yesterday! I haven't had a chance to use it much, though, but I thought some of you guys might want to know that it IS shipping!

External observations...

Comes with 4 disks:
- Pagestream program disk
- Pagestream fonts disk
- 2 CompuGraphic fonts disks

Documentation:
- A staple-bound "QuickStart Manual" -- tells about installation of the software and gives a VERY basic start to desktop publishing.

- A "User Guide" -- This is a spiral bound manual, as opposed to the 3-ring binding of the previous version. I find this easier to work with; it lays flatter, and the pages are easier to turn.

- A function reference card.

I'll comment on the workings of the program once I get a good grasp of the new features. (I'm sure I won't be the only one!)

Tony

1218. Mupfel w/Neodesk 3

Newsgroup: comp.sys.atari.st
Date: 1991-07-12 00:37:13 UTC
From: bill@mwca.UUCP
Message-ID: <1889@mwca.UUCP>
Source record: 230436

I've seen some wierdness when using Neodesk 3 and Mupfel, any help would be appreciated:

If I run Mupfel (the CLI portion of Gemini) from Neodesk, upon exiting Mupfel I will be returned to the desktop, not back to Neodesk. This is regardless of whether I have Neodesk configured to unload itself before executing Mupfel.

Also (and stranger) if I run Mupfel from Neodesk, any program I run from Mupfel will run _twice_. If I type "arc -v filename.arc", it will execute normally, then execute again! This happens consistently, and I assume is related to the above problem. It isn't only arc that does this, it's any program (I believe), and I've tried it with PATH set to null and no aliases.

You haven't been a Lynx owner long, have you? B-) In any case, let's remember

(1) There's still another 5-and-a-half months before the end of the year. The "30 games release" is for all of '91.
(2) Well, WARBIRDS has been released, and I've seen CHECKERED FLAG, TURBO SUB, VIKING CHILD, SCRAPYARD DOG, HARD DRIVIN', and ISHIDO for the Lynx. I suggest you read rec.games.video to get the latest Lynx news.
(3) Atari's switching from one factory in Taiwan to three. If this is where Lynx games are manufactured, this action can understandably have an impact on game production.
(4) This _is_ Atari, after all. Le sigh.

--R.J.
B-)

P.S. You can always go buy Telegames' FIDELITY ULTIMATE CHESS CHALLENGE for the Lynx, too. And I hear that Telegames' QIX and KRAZY ACE MINIATURE GOLF are due out this month...

From: irons@chinet.chi.il.us
Message-ID: <1991Jul12.022055.11174@chinet.chi.il.us>
Source record: 230432

This is a repost of a previous message with an updated list.

I am giving my Atari to the kids and want to sell most of my ST
software collection. These are all original release diskettes,
most with the original documentation. They are priced to sell
as I need the money to buy a scanner for my 386SX. I have the
following items:

All-Aboard $5 Alt $3
Ansiterm $3 DBMan v. 3.00G $10
Deep Space $5 Disk Doctor $3
Elite $5
Flexcessory $3
Flight Sim & sc.7,11,Er $15
Hrd Dsk Accel $3 High Roller $5
Interlink-ST $5 K-Switch $3
Leviathan $3 M-Disk Plus $3
Major Motion $3
Menace $3 Mi-Term 3.0 $5
Multi-Desk $3
Oids $3 Oscar $3
Personal Pascal $5
Procopy & A-Copier $5 Renegade $3
Rogue $5 Silent Service $3
St-Control $10
StKey $3 STOS & Compiler $15
Sundog $3 Tanglewood $5
Test Drive $5 Tracker $3
Trivia Challenge $3
PC-Ditto I $10

This is an editted list with all items remaining as of 7-6-91.
If interested in any or all of these please call Jim Irons at
708-386-0804. Make me an offer for the whole thing and I'll
come down even further.

1222. PageStream, TT

Hello once again!

I'm refereing to my former postage on this newsnet sig. Also as a repl

to one of the Amiga users who replied to me. I believe his name is Mark.
Mark, as I read your letter, I've sensed a lot of tension towards me.
Most of your feedback answers did not make a point. You should re-read my
former letter and within it you'd probablyu find most of your questions
already answered.
I didn't say that a person which compares computers is a dimwit. I sai

that a person that compares computers and then raves at other people is a
dimwit. AAlso, I did not say not to expose yourself to other computer
sigs. I also am very interested in other machines other then mine.
The bottom line of my message was not the fact that anyone who is trul

satisfied with his machine should lock himself in a dark closet and throw
the key. What I meant to say is that anyone who is satisfied with his
machine (i.e. his machine does anything he needs, and he really like
using it for his purposes) does not need to switch to another machine.
If you thought your Timex Sinclair 1000 did the job for you, then you
would stick with it. But if you got to the point where you said "Gosh, I
can't get the work done right!" then you probably bought another machine.
If the Timex did the job and satisfied you, then you would never need to
change it. Thats the point.
My ST couldn't satisfy my needs concerning the developement of Intel
based software for the firm I work for. That is why I changed it. You
might try to ask, "Why didn't you by a 286 then? It's much cheaper then a
386!" - the reason is that my project concluded work on a 386 chip. I
didn't buy a 486 because I didn't need such a machine. a 386 was enough.
As I see it, the strongest factor in a computer is the price, not the
specifics. There is no such thing as a 'Volvo Envy'. I would not eve at m

chief of project for having a 486. My 386 is just fine for me. As I can
see it, I'd never have enough cash to spend on a 486.
Concerning the price. What most of you Amiga users do not know is the
fact that the STe and TT are priced much below the Commodore products.
Just to let you know, a TT costs here (Israel) around $2500 with the
TM194 and a 50 Mb HD, while the A300 costs here a wopping $6000. The STe
is priced just under $900 for a full system, while an A500 costs $1300.
I'd never buy a TT though. I don't need it, since the ST satsifies my
enough.

Ok, enough for this. I hope most of you Amiga/Atari users will
understand that the Amiga and the Atari can not be compared. The Amiga is
nice, but so is the ST. So is the Mac. So is the PC. So is the Sparc...

Good luck dudes, and have a happy life.

>and the zoo 'I' option is clumsy.

This would be quite useful... Might take more hacking around than first
meets the eye, since readdir() is used to read the *zoo* directory, not
the unix directory. This means those may have to be renamed first before
zoo can independently read directories.

I might at some time try to add this feature, if I get the time, and
nobody beats me to it...

Would anybody be willing to produce a Soundtracker that can play through
Microdeal's PLAYBACK cartridge. As I have an STFM with it.

Lars-Erik... has come the closest, with PLAYER. It plays only through
the left port though. So still mono although it does go through the cartridge.

If anybody is willing and needs the sources how to program the cartridge
please get in touch.

Alan Hourihane

1229. Double Click idea

Newsgroup: comp.sys.atari.st
Date: 1991-07-12 07:56:55 UTC
From: schuller@DUTIAA.TUDELFT.NL
Message-ID: <9107120756.AA20844@dutiaa.tudelft.nl>
Source record: 230449

Hi all,
I've got to agree with someone's idea about a DC program of the week:
a program that will make the mouse appear or disappear with a key-combination.
Now I know that hidemouse/showmouse calls are counted, so that one showmouse
call will not undo two hidemouse calls, but it could be done one call at a
time. There are quite a lot of programs still out (although mostly old programs)
that manage to 'lose' the mouse pointer in some way, so I'd like to see a
program doing this. Are you listening Double Click?
Hildo Biersma, schuller@dutiad.tudelft.nl

1230. Re: crabs -- Screen-eating program for MiNT

Newsgroup: comp.sys.atari.st
Date: 1991-07-12 08:49:24 UTC
From: ralph@laas.fr
Message-ID: <RALPH.91Jul12104924@orion.laas.fr>
Source record: 230091
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

There seems to be a problem with the crabexe.lzh file that was posted.
Neither Unix uudecode or uud or even uud on my ST could decode this
file.

In article <binaries.15.53@twitterpater.eng.sun.com> koreth@twitterpater.eng.sun.com
(Steven Grimm) writes:
| table
| !"#$%&'()*+,-./0123456789:;<=>?
| @ABCDEFGHIJKLMNOPQRSTUVWXYZ[\]^_
| begin 644 crabexe.lzh
| M'\TM;&@Q+68< !:-0 0E6K%B "4-204)3+E144,*)]FFQF'NG[!@R#==Cz

| ..8>OG83<SX LGU[._T "Jt
| s
| end

On the ST uud complained about the sequence letter <J> in the next to
last line. The Unix versions all did a nice `segmentation violation.'
Have others successfully recovered this file?

Cheers,

Sounds as if Neodesk catches the AES trap and does his own things with
shel_read/shel_write (very bad idea). Can you check whether they changed
the AES trap (do the use XBRA?).

Simplest solution: use Gemini instead.

1232. new mgif 3.5 for 1 MB systems

Newsgroup: comp.sys.atari.st
Date: 1991-07-12 13:30:14 UTC
From: rosenkra@convex.com
Message-ID: <1991Jul12.133014.8128@convex.com>
Source record: 230353

well, after numerous requests, i uploaded to atari.archive a new executable for mgif 3.5 to atari.archive. look for file mgif35xx.arc. contained therein is an executable .ttp and a readme.xx file. all source and documentation are in the original files (mgif35s.arc and mgif35b.arc) which were uploaded there some time ago. recall that mgif is a gif viewer for monochrome that displays simulated grayscale using so-called flicker mode. it also does lots of image processing on images and can save the screen images to a file. it can also view these saved screen images (mgif -fl file.fl ...).

this new version *should* work on 1 MB systems tho it was not tested. size mgif.ttp sez 870kB plus 32kB for stack, or about 900kB which i am guessing will fit on a 1 MB system that does not have lots of DAs and TSRs. one of the guys who sent me mail should try it and let me know that it works (or does not work in which case i will make it smaller still).

it will handle .GIF files up to 150000 bytes long. don't even try it on larger files. i don't think it checks while reading the GIF itself for too large file. however, it should fail gracefully if width*height of the image is > 260000. that means you can view 640x400 images but not 640x480 images which are too big (and usually come from VGA/EGA). that's life.

again, this is only for 640x400 monochrome displays on ST/STe (i.e. not TT). it will not work on color, with overscan, and with systems not supporting line A.

enjoy...

>or mail it to me. I need HDX 3.01 and HINSTALL 3.01.

I ran into this same problem some time ago. The problem seems to be that the archive contains incorrect checksums. The version of lharc I used to unpack it (LHarc for UNIX V1.02 Copyright(C) 1989 Y.Tagawa special Amiga option by S. Becker) complains about the bad checksums but unpacks the files correctly anyway. The three files that give the checksum errors are themselves .lzh files which must be further unpacked.

I have repacked the directory tree as a single .lzh archive and uploaded it to atari.archive.umich.edu as file /atari/new/hdx301.lzh.

1234. D.T.P. Comparison

Newsgroup: comp.sys.atari.st
Date: 1991-07-12 15:00:21 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <9107121500.AA27874@top.magnus.acs.ohio-state.edu>
Source record: 230360

Recently there was a question posted about Calamus & Pagestream, I answered, and thought it might be nice to post what I wrote as well, so here it is. Some of it answers specific questions, which I have not bothered to retype since the question asked is probably obvious from the answers (or opinions) I wrote.

In answer to your questions about Calamus & PageStream, either one could probably be useful to you. I have used both extensively, and personally prefer Calamus for any number of reasons, but you may have different needs and therefore not agree at all with my conclusions.

1) Both Calamus & Pagestream have extensive (and good) text importing. Also, both programs can have pages inserted wherever necessary, they are pretty comparable in this area.

2) Calamus has many more numbering features, but PageStream 2.1 may change this. Calamus supports things like page, chapter, and section numbering, but I don't think either program has "Auto-numbering" of figures, tables etc., I'm not really even sure what you mean by that since most

of my work is for other people and is in the range of Brochures & Newsletters, not technical papers or manuals, but I have not found reference to a feature resembling this in either program.

3) Calamus can create a Table of Contents, but will not alphabetize, so you wil
l
have to export the text, import it into a program that can sort it, and then bring it back into Calamus, which is actually not as much as a hassle as it seems. I can't remember these features in PageStream, but I have not used it in nearly a year now, so you may want to check directly with SoftLogik, especially now that 2.1 is available. Note than Calamus SL is supposed to be available this month or in August as well, and it sounds like it will be the state-of-the-art D.T.P. program in the world.

4) In terms of image handling, Calamus has the better feature period. It can crop, and even scan images directly into the program. Calamus has special scaling for half-tones, and can optimize graphics for either the screen or your

specific printer. PageStream can import more formats, including PostScript however, which means you can also create with Calamus Outline Art and use Convert2X to convert it to postscript and use it in PageStream. You should use .IMG or some similar format, not DEGAS since DEGAS does not support any resolutions other than screen resolutions.

Other things of importance. Unless you are using a PostScript printer, or Ultrascript, then Calamus as FAR, FAR superior output. If you are using PostScript then Calamus just has FAR superior output. Calamus is fast, provides better character definition and kerning (much better), can be set to

produce finer grey scales or smoother & finer gradients than PostScript. The difference is really amazing. PageStream's normal output is slow and poor, so use PostScript with it or you will not be satisfied with the results.

Learning the programs is also different. PageStream is easier to learn at first
,
but you also have to remember a lot more bugs to avoid than with Calamus (2.1 may change this I hope). Calamus takes more time to learn, but is a joy to

use and really grows on you. The more you use Calamus the more you like it, which is the opposite of most software.
Speed is an important factor. Calamus is several times faster than PageStream (again, this may have changed with 2.1 of PageStream, but I have heard that it too is very ssllooww). Everything Calamus does just flies. Most notable is the way Calamus displays its vector graphics (like PostScript). Most (all I believ e)
other D.T.P. programs just display an empty box with an X through it.
Calamus displays the graphic wonderfully, quickly, and there is literally no difference in speed between scrolling though a Vector Graphic and an Empty Screen (that's fast!)

In terms of comparing these programs to Mac programs, I think you will be pleased with Calamus & PageStream 2.1, but probably not 1.8. Calamus really blows the Mac programs away when it comes to speed and memory management, you can do a lot more with your memory in Calamus than in any of the Mac programs, for example, I have a document done in Calamus with 22 300dpi graphics in it, plus a vector graphic underlay on each page except for the covers, which have 4 original Vector Graphics of their own. The raster graphics are at least 100K or so each, and severaly are more than 400. I Originally tried set this document up in PageMaker 4.0 and hit my memory limit (4 megs) at 7, yep, 7 of those 22 raster graphics, and about 8 of the final 20 pages it became in Calamus. With 4 megs of memory Calamus will load this 2.5 meg file and print in all from memory (no hard drive access during printing).

As for features, the lack of color in the current
version of Calamus is a shame, but in terms of B&W it is great, equaling or surpassing the Mac programs in most ways.

I own a Desktop Publishing Company and started out with all the Mac Programs (u sing the 128 & GCR of course) that I could. Eventually I went with the Atari so ftware because I was dissatified with the Mac software. One of my friends here in town also own a D.T.P. company, and uses the Atari/Spectre combo, a Dos mach ine, and an Amiga for his business. He creates literally some of the best work I have ever seen, period. His software of choice is also Calamus & Pagestream. Neither one of us thought that this would happen, we expected to use the Mac so ftware, but both of us came to the same conclusion. He even said (while examini ng PageMaker) "Compared to the Atari stuff this looks Archiac and Clunky". I t end to agree with this.

1239. running System 7 on ATARI

Newsgroup: comp.sys.atari.st
Date: 1991-07-12 16:19:03 UTC
From: shawl@kuhub.cc.ukans.edu
Message-ID: <1991Jul12.111903.32053@kuhub.cc.ukans.edu>
Source record: 230361

Someone mentioned that perhaps one day, ATARI will run the MAC System 7. I think I am in a unique position to comment on this, since I am the owner of 2 STs, and had a MACII si purchased for me in May; I loaded System 7 last week. I have been using NEODESK for a while, and upgraded 6-9 months ago.

Although I really do like the MAC a lot (and I never thought I would hear myself say that!), NEODESK gives the ST many of the advantages the non-networking MAC user gets with System 7 (but, since I've had it for only a week, I'm certainly not an expert). So, while I have absolutely no affiliation with the NEODESK people, I would recommend looking at it; I have found it very useful.

As to the MAC---YES, it is expensive. But I have been able to PRODUCE quite a bit with it; I am just glad I do not have an MS-DOS machine! The software I have purchased is high class and works very well. The compatibility I have at work is certainly helpful (I've been the only person with ATARI in the office and that has been a bit difficult; it still is, but at least I can bring in a MAC disc and get stuff out on the laser printers). In any case, the ST has been, and continues to be, a very useful machine.
useful machine.

I have to disagree somewhat.

Calamus' font-scaling output is (obviously) much better than PageStream's
1.8's own font-scaling output.

Calamus is much faster.

Calamus' output of nontextual material on 300dpi laser printers is
superior.

But in my experience, the quality of Calamus' fonts is a notch or two
below the quality of genuine PostScript fonts from reputable type houses.
Maybe this is merely a shortcoming of the fonts that happen to have been
installed on the systems I've seen, but it is a significant difference.

I don't know the details, but I'm under the impression that the Calamus
font- scaling routines and fonts are adapted from CompuGraphic originals.
Historically -- and here I'm talking 1970s and 1980s -- CG has been a step
behind other suppliers in terms of font quality. That pattern seems to be
repeated on the digital desktop platforms. (Note: This has never been true
for the entire type library, but it has been true of enough important
typefaces to be of real concern.)

There is something else worth considering, and that is the portability of
PostScript. If you want higher quality output than desktop laser printers
can provide, it's simple to spool the .PS file to a floppy (or a series of
floppies) and hand-carry the data to a commercial type house for output at
up to 2400dpi or so. While it is true that there is a RIP interface that
will allow Calamus to produce high-resolution output on Linotronic film
recorders, such installations are rare.

1245. Spectre v.3 had problem with date/time in WP2.0.1

Newsgroup: comp.sys.atari.st
Date: 1991-07-12 19:07:16 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1991Jul12.190716.8802@rodan.acs.syr.edu>
Source record: 230313

Well, doing one of those introductory tutorials actually proved useful for once. While doing the Macro tutorial for WordPerfect 2.0.1 on Spectre v.3, I found that Spectre crashes when you try to access auto date/time from the tools menu!

I called Gadgets, and it sounds like they don't even have the new WP version yet, so this was news to the operator (who will pass on the info). She suggested WP may be making a hardware call, which would mess things up....Too bad, since Write Now and MS Word both are able to insert date/time stamps in documents withouth any problems for Spectre!

I called WordPerfect Corp, and the technician I spoke with did not know how the date/time stamp was achieved (nor was he able to find out). He said he did contact the Atari section, where they seemed to have a Spectre, and he said they were able to see the problem.

Well, I haven't noticed any other problems, although I've really only just started to use WP for the Mac recently. Has anybody else noticed any other problems? or is this the only one (I hope)?

I also hope Gadgets and/or WordPerfect can clear this up.

Can you say if Atari will be repairing machines with this fault
free of charge, regardless of whether they are still covered by the 1 year
guarantee? I have a 520STE from April 1990 which has had the video/sound
problems since new and I too thought this was just how STEs were until other
complaints appeared on the net.

Am I stuck with a 'BROKEN' machine? Or maybe standard STEs ARE supposed
to be this way!

1247. Re: Need 68000 socket adapter

Newsgroup: comp.sys.atari.st
Date: 1991-07-12 20:11:42 UTC
From: hyc@hanauma.jpl.nasa.gov
Message-ID: <1991Jul12.201142.14065@jato.jpl.nasa.gov>
Source record: 230373

Well, just for the record, the 68030 board from CSA previously mentioned in this group will not work in an Atari. The CSA board is designed to run with the 7.14MHz clock on the Amiga, and couldn't run with the 8MHz clock in the STe I tried. Sigh...

(Got bombs in 68030 mode, got blank screen in 68000 mode.) Back to waiting for GBS or FAST Tech, I guess.

I suppose I would agree, I must also say, that with the advent of
half way decent programming PACKAGE, notice SINGULAR HERE, Turbo C
I find my ST a pleasure to use...god EVEN EXCITING.

The package is, well, you have to watch out for the compiler making
naughty assumptions with 32 bit constants, but other than that the
people who designed the compiler and tools are obviously very talented.

I only wish they would invest the time to make English Docs, they have
quite a fan following here in the USA.

Wiener,

Well, I couldn't control myself. When people actually try to go throught hassle of FONT drivers, pic formats, etc...just to do page layout on the ST I burst into a laugh mode.

It is like using a sledge hammer to straighten a toothpick.

As for my Grammar, I am a computer scientist, not an english major. Just a journalism minor. :)

But still, you can't be serious about doing anything but VERY simple layout on the ST.

DTP would be great if Atari came to thier senses and endorsed a real OS. Not this GEM BS. I however, I do like TOS. And like its layout, for what I have to do.

Source record: 230372

Dear Steve,

I may be a jerk, but a jerk that speaks the truth. The only way
you couldn't possibly think that the ST's DTP GEM apps were not junk
is if you never used anything else. Which is like viewing the computing
world through the little Atari hole you own on your desk.

Atari has to seriously rethink its system software. I mean, when people
in the PD go through the very intense trouble of writing thier own UNIX
solutions, like MINT.

Something is SERIOUSLY WRONG in Atari Land.

I would have blown 1500 bucks on a TT, if Atari's system software
was realistic to suit the hardware...but TOS? TOS on a 030?

WHAT A WASTE.

This week's program has been sent to atari.archive.umich.edu (ftp site) and comp.binaries.atari.st.

DC Disk Stat gives you * a lot * of disk structure information about the disk of your choice. Stats include sectors, sectors per track, tracks, clusters, sides, (much more), etc.

DC Disk Stat has an easy-to-use GEM interface and can be run as a desk accessory or a program.

100% assembly. ST, STe and TT compatible. (Not LOW rez).

(This is no joke.)

- mike vederman / double click software

BTW - we are _always_ taking ideas for more weekly programs!

>some amigas.. I understand Kickstart is in the ROMS on some machines...)
^^^^
SOME machines? KickStart has been shipping IN ROM since 1987! Every single Amiga 500, 2000, and 2500 have KS on a chip, containing all of the low-level OS routines. KickStart 2 will be available in ROM by the 3rd quarter for ALL Amiga systems. Only the DOS is loaded into RAM. This kind of statement really makes me wonder how much you do know about Amigas. The ST series are good machines... I almost bought one. But Atari's lack of dealers in my area and the performance of a true preemptive multitasking environment led me to Amiga.

NOTE: I am not some Amiga fanatic who thinks Atari users are the scum of the earth. I still have (and occasionally use) an Atari 800 and an Atari 1200XL. I used Macs in school and IBMs in the workforce. I'm not here to convince you that I have a "superior" machine and that you should dump your ST and drive to your local Amiga dealer immediately. It's just that the above KickStart statement really needed correcting.

I thought that I should mention something about Pagestream 2.1 at this point...

I think that one of the reasons that Calamus output may be better is that Calamus has nice solid Compugrapic fonts, while Pagestream traditionally had it's own font format, and so had inferior fonts.

Luckly, Pagestream 2.1 solves this; not only can it use Pagestream fonts, but also Compugraphic and Adobe Type I postscript fonts, on the screen as well as on paper!! Thus, you should be able to have much better looking output from Pagestream in the future, and be able to get quality fonts.

Even if Pagestream improved on nothing else at all, this would still make it worth getting in my opinion...

1255. More problems with WP2.0.1 with Spectre

Newsgroup: comp.sys.atari.st
Date: 1991-07-13 05:31:26 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1991Jul13.053126.10033@rodan.acs.syr.edu>
Source record: 230312

Well, I have now done a little more work on the Macro tutorial, and I've had WP crash a few times while working with a macro. I've had three crashes that do not seem to be repeatable. I have found one problem, however:
For the command "EndIf"...when I type it without a space between "End" and "If", Spectre crashes...when I type a space between "End" and "If", Spectre does not crash. Now there are other commands that I've typed with no spaces and there was no problem...so, this seems to be a problem particular to this command (although there may be others, too).

Back in May, before I bought WP, I asked on the net whether or not v.2 worked with Spectre...a couple of people responded that it worked. Now that I've worked with it for a very tiny bit, I've started to come up with problems...
I guess maybe simple typing and formatting do not cause too many problems (I haven't discovered any yet), but more complex things, e.g. inserting auto date/time, or macro usage, do not seem so stable. Anybody else out there using WP2.0.1? with or without problems?

I hope these things can be cleared up...the more I use this program, the better it looks (if it only wouldn't crash!)

Well here is another one, I use Flash all the time and often save
the Capture Buffer, Well I have lost a Few Captures because you save
a File, there no check that the File Name you are using is allready there,
ie, no check for duplicate file names, so a TSR to work with Flash, when
saving marked blocks would be very useful, ie check for duplicate file name..

The folks who know me are probably doubled up laughing.

I know which side of the type goes up. I'm an editor at the Star Tribune in Minneapolis, the largest newspaper between Chicago and Los Angeles. We were a pioneer in electronic pagination. Paul Brainerd, founder of Aldus, got his start at the Star Tribune working with Atex to implement News Layout. Over the last 20 years or so, I've used everything from handset wooden type to Autologic pagesetters -- and not just by remote control, either; I owned and published weekly newspapers for awhile, and I've gotten my hands dirty.

Calamus and PageStream are not Quark X-Press, but neither are they junk. As far as they go, they do what they're supposed to do, and they are more reliable than a couple of far more expensive systems I've encountered (including PageMaker for Windows).

I've spent more on a hotel room than the street price of PageStream. I've spent more on a single digital font of Times Roman/bold/italic (for a Compugraphic 8600 45-pica CRT typesetter) than the street price of an STE. Certainly I'd like to see more performance for less money, a cheap and easy-to-use turnkey Unix system, and dealers that can get shipments instead of excuses from Atari Corp. But I have enough perspective to recognize reliability and a bargain when I see them.

Hi, Pete.

I use C-Lab's NOTATOR, which is outstanding. The new version, 3.1, finally
incorporates all the font and layout capabilities you'd ever need.

However, it's neither shareware nor cheap (about $500), probably because it
also includes the world's greatest sequencing software.

1261. Help with UniTerm

Newsgroup: comp.sys.atari.st
Date: 1991-07-13 15:25:37 UTC
From: 72347.2767@CompuServe.COM
Message-ID: <910713152537_72347.2767_EHA52-1@CompuServe.COM>
Source record: 230386

I've been using UniTerm to connect to various Vaxen since 1986. I've had one nagging problem since I first began using the program. Quite often when I use UniTerm with Eve or EDT pressing the Return key causes a Bus Error. The fault looks as though the program references a string as if it were the address of the string. The error has been present in versions 2.0b-2.0e (the highest version I have). It's been present on my ST with TOS 1.0-1.4. (I have a color system.) And the VMS versions range from 4-the latest for 8650s (forget the revision number).

I'd be interested to know whether anyone else has experienced it and whether there is a known reason for the failure. It causes some real problems because UniTerm takes over a number of system vectors and doesn't reassign them on error exits (ever heard of safe signal processing?).

Please respond directly as I don't often get to read the news group. I never get to read comp.sys.atari.st in fact.

1265. ZOO problems

Newsgroup: comp.sys.atari.st
Date: 1991-07-13 17:46:49 UTC
From: silvert@cs.dal.ca
Message-ID: <1991Jul13.174649.18243@cs.dal.ca>
Source record: 230392

I recently ran into a problem trying to archive a set of files, one of which was over 260KB. ZOO gave me a read error on the file. So I ported the rest of my archive over to a Unix system along with the problem file, extracted all the files from the archive and re-archived them all. The problem file archived without any difficulty.

Comparing the two archives I noted that both the ST and the Unix ZOO archives show the same file lengths before and after archiving, but the ST archive is roughly twice the size of the Unix archive. There must be a lot of dead space in it. Anyone able to shed light on this?

The ZOO used on the ST is version 2.01STe, ported to the ST 89/3/30.

Source record: 230394

ford@tardis.computer-science.edinburgh.ac.uk writes:

>From what I've heard, the only ST QL emulator so far (unless Tony Tebby's
>managed to get his QDOS compatable OS on the market) is the hardware/software
>emulator from some german company, and I don't even know if that exists any
>more. (The last QL World I got was March last year).

This software is written by Tony Tebby and Jochen Merz. The hardware is made in Germany and the complete emulator package is sold by Jochen Merz Software. Full device support is included, also for removeable hard disks. The hardware also provides overscan for the ST which can be used by GEM. The latest QDOS version which I have still needs the extra hardware. Later on the hardware should become optional. There ought to be support for other screen-enhancing hardware.

There is also a software only emulator made in Sweden. It is a PD patch for QDOS, so it is necessary to have a QL computer with the Trumpcard disk interface in order to set it up. The only device support is for keyboard and floppy disk, with a software screen emulator for the 512*256 4-colour screen mode. It works with either a colour or mono monitor. If you're out there listening Johan, maybe you can post a message about it.

I have both emulators but have not had time/facilities to set up the PD one yet for comparison. When I have done this I will post a review of them both.

For the sake of completeness, I am mentioning that there is also an earlier hardware-based emulator which was made by Futura Datasystems in Norway. This required the original QL video chip which can be hard to obtain. The advantage is that the video system is 100% QL but there are no extra modes provided by the hardware. Less than a year ago, Jochen Merz was offering a choice between the Norwegian and the German QL video board with the QL emulator. The emulator itself is essentially a software product.

Newsgroup: comp.sys.atari.st
Date: 1991-07-13 18:46:29 UTC
From: lch3e@holmes.acc.Virginia.EDU
Message-ID: <1991Jul13.184629.16508@murdoch.acc.Virginia.EDU>
Source record: 230395

I encourage folks who can't afford other computers to buy the ST. Most
of them end up with one floppy drive, no HDD.
We'd like to be able to boot a disk, copying everything on it to a RAM
disk it creates, all done automatically on bootup. Then we could run that
program from RAM. RAMSTART for the Mac does this. It takes just as long
to load it to the RAM disk and then run it, as it does to run it from the
floppy; but then in using the program you have the extra speed.
Having a user-selectable drive name, or else defaulting to drive A:,
would make it useable with fussy programs like Timeworks DTP.

Please don't comment with "why dont you buy a hard drive/pagestream/etc."
There are a lot of people in the world who can't afford a small fortune
for a computer, much less adding harddrives. The ST is ideal for them;
excellent service from 1 disk drive, even with a TV set.

Thanx for your time and consideration.

FASt tech is in my neighbourhood:
FaST Technologies
14 Lovejoy Road
Andover, MA 01810
(508) 475-3810

I am currently using their T20 a 20Mhz 68K accelerator. I also go over to play with their 68030 accelerator, which is coming along nicely.

Before everyone tells me that moto does'nt make a 20Mhz 68k, what FaST Tech is doing is running specially selected 16Mhz chips at 20Mhz.

Give jim a call. he also has other neat toys in the works ...

cheers,

Sorry, I could not resist.
Although I could not care less for most of the subject matter on the net recently, with all the Amiga/Atari wars going on and such, I just had to advise Greg here that he had better get a new minor. If he thinks he can get a job at any publisher, either newspaper or magazine or whatever, with his gawd-awful grammar (and spelling), he is sadly mistaken. I have read most of his posts from the day I first started reading this newsgroup some time ago, and NOT ONE had proper English. I am sorry, but not being an English major is no excuse. IT IS YOUR NATIVE LANGUAGE FOR GOD'S SAKE. Do you speak like you write? Does anyone understand you? What the hell?

I had the same 'problem', still don't know where it came from, but I have the
feeling it's a program (Tempus, Wordplus ?) that's messing things up. Does
this happen *after* using some program's, have you got new AUTO-programs
installed or ACC's? Check that out, I don't think it's a virus (all my virus
scanners couldn't find one, and I *always* boot from a clean boot-disk).

It should at least not be allowed to overheat. 20 MHz from a 16 MHz part can be reliable, but only under the right conditions.

>Especially since the ST is NOT at any point a stable hardware design.
>Even during periods of manufacturing the boards electrical chracteristics
>change often enough to make such a upgrade dubious.

I shall not argue whether your statement is true or not, it is simply irrelevant. AFAIK all ST accelerator boards have one thing in common, they communicate with the ST hardware at 8 MHz over the ST's 8 MHz CPU bus. The ST with the upgrade will therefore be exactly as reliable as it was before the upgrade. Of course if the upgrade itself is unreliable then that's entirely a different story.

>I could be wrong...but I am such a know it all, that seldom occurs. :)

More often than you like to think, or does :) indicate sarcasm?

Simplest solution:

Put a shell in the auto folder, and have the startup script
create the ramdisk, then do the copying. I'm not sure what would
be the best shell for this. A tos equivalent of init.prg that
comes with MiNT is what you need.

The ICD price looks high. I got my adaptor for about $80 from D&P Computer Supply (1-800-535-4290). ICD software is far better than Supra's. ICD's adaptor definitely works with the Syquest (and it reports a media change in the corner of the screen). Also, I see more ICD ads than Supra ads. If I were you, I would get the ICD adaptor.

One advantage that the ICD has over the Supra is the corner report of any sense codes from the drive (the above mentioned media change is one of them). I have only seen such a code a couple of times (they were both "recovered read error", and occured due to a bump of the desk).

Date: 1991-07-15 04:27:02 UTC
From: sytang@lamar.ColoState.EDU
Message-ID: <16202@ccncsu.ColoState.EDU>
Source record: 230318

No, I don't have answer just have some thoughts about the 2.0 version after using it both on the Spectre and Mac (Classic and SE). While WP addes some new stuffs and improve the function, they also make it run very slow on the lower end of Mac. (Try to let it scroll a page of Mathematical equations with Greek , integration, etc) On the MacII and 030 family it runs reasonable well but on the basic Mac it's not like the 1.* version.
Althought it soppose to be like PC5.1 version, it's missing some of the 5.1 functions.

> without any additional investment on your part.

You seem to be under some sort of misapprehension here. The Amiga and ST have very similar hardware, at least from the point of view of multi-tasking.

The fact that the Amiga has multi-tasking whereas the ST does not is purely down to the Atari's TOS not providing software support for the sort of multi-tasking which AmigaDOS supports.

If you doubt this, look at MINIX, which provides exactly the same sort of multi-tasking on both Amiga and ST, with no extra hardware.

There are things you need in order to manage multi-tasking; a restartable instruction stream helps a lot, as does a sensible interrupt system. The 68000 is (just about) suitable.

There *are* things you can build into the hardware to make multi-tasking better. Memory protection and virtual memory are the most important; for those you need a 68030, as found in the A3000 or TT.

> apple and ibm,soon atari and commodore will see eye to eye,cdtv a step
> forward what a concept!@

Atari have already announced that they will be following the CD-I standard,
not Commodore's proprietary CDTV standard.

CDTV is very much a case of "What can we throw together quickly in order to
grab some market share before everyone else?" And that's the sort of
attitude which has killed countless products in the past, the one real
counterexample being the IBM PC which has staggered on regardless of its
fundamental design flaws and incompatabilities with the standards of the
time.

But Commodore aren't IBM. They can't hope to push CDTV into being a de facto
standard when they're faced with companies like Sony and Philips.

1292. Re: Multitasking for ST (to sell)

Newsgroup: comp.sys.atari.st
Date: 1991-07-15 08:32:04 UTC
From: ford@tardis.computer-science.edinburgh.ac.uk
Message-ID: <9107150828.AA07133@ucbvax.berkeley.edu>
Source record: 230320

For the record.. TTs use the same technique to change between the five lower resolutions as the ST does between low res and medium res.

1293. TT compatability...

Newsgroup: comp.sys.atari.st
Date: 1991-07-15 09:03:39 UTC
From: ford@tardis.computer-science.edinburgh.ac.uk
Message-ID: <9107150906.AA07661@ucbvax.berkeley.edu>
Source record: 230321

I recieved my new TT on Saturday :-)

The first thing I did was to do a quick check of all the ST software I could get hold of and see what was and wasn't compatable.. here is a list of the results:-

Calamus Works sometimes, when the program doesn't think it can't work under TOS version 3.
1st Word+ Works in ST high, except for having the wrong text font size.
Spectre GCR Well... I've got version 3.0, but I canne get it to work.. it locks up (as does GCRTEST) at the first try at accessing the floppies in GCR mode.
Neodesk 2 Works fine.
MiNT 0.8 Works fine (except for the exception handling).
GNU CC 1.37.1 Everything works except the preprocessor, which doesn't parse #if blocks properly.
Starglider 2 Works fine! (and incredibly smoothly :-)) But no sound effects :-(
Starglider 1 Starts ok, but seems to crash after startup screen (though this may be just my copy as it's a bit dodgy on the ST)
Jinxter Works fine.
Hard Drivin' Works fine. (If a little fast)
Populous Starts ok (thoug the demo don't work), but falls over after about a minute.
Elite Gives up on booting, as in it says there's not enough memory and locks up the machine. It give the same symptoms on the ST when you try to run it with the hard disk driver installed.
Psion Chess Works fine.
F-15 Combat Pilot
(Digital Integration)
Crashes out during booting.
Marble Madness Works great.

All these tests were done with and without the processor cache on. Those programs which could be booted from floppy were.

Well.. it seems the compatibility of the TT is patchy at best, though this might just be that I've just been unlucky with the programs I've tried.

Stephen Usher

PS. Should the TTs internal speaker sound as if it's blown?

Who cares, at least we may now see English documentation and perhaps
even C++. I
think it is better to have a small company dedicated to a growing
product rather
than a large company tending a static product.

This is a real bug in 1WP which the TT TOS reveals. You can get an
updated version, V3.15a, from Atari/GST.

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources
```

CSAST
What sort of articles would interest people reading comp.sys.atari.st?
==========

The most interesting articles are technical articles, impressions of
software/hardware, information on Atari user-groups and shows, or helpful
hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better
than...', especially when cross-posted outside of comp.sys.atari.st. If
you don't know how to eliminate other newsgroups from a reply to an article
which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local
distribution of comp.sys.atari.st. Those outside the United States have
little desire to read about that neat bit of [hard/soft]ware you're selling
when you live in the U.S.A. If you don't know how to restrict distribution of
a posting, ask your systems administrator.

Many articles are in the form of "How do I...?" or "Where do I...?" In this
article, I will try to answer some of the most-often asked questions.

PD
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

For Mail Service:

archive-server@twitterpater.Eng.Sun.COM:

(Panarthea has been moved to a new system called Twitterpater.)

Twitterpater holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@twitterpater.eng.sun.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

Bart help may be attained by mailing atari@atari.archive.umich.edu and
enclosing the word 'help' in the body of the message. If
you are from a uucp site, please enclose this statement also

'path host1!host2!....', where host1!host2!... is your path.
Please read the help file completely before you ask questions,
and then send any you may have to jon@atari.archive.umich.edu. Jeff
Weiner will only forward them to Jon, so please save him the time.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu

For anonymous FTP: atari.archive.umich.edu [141.211.164.8]

User anonymous
<enter password>
cd /atari

For anonymous FTP in the UK: uk.ac.lancs.pdsoft

User pdsoft
Password pdsoft

This is a national public domain archive, available to sites in the UK only
via JANET. Mail access is available from within the UK - send mail to
archive-server@lancs.pdsoft for information.

For anonymous FTP in Europe: ftp.Informatik.Uni-dortmund.DE
[129.217.64.63]

Some selected Atari ST software is in the directory pub/comp/atari-st.

NOTE: The server has moved from unido.informatik.uni-dortmund.de. FTP
requests to the old address direct you to the address given above. I do
not know the current status of the old mailserver, but would appreciate
learning if it still exists.

For anonymous FTP in Europe: cs.uni-sb.de [134.96.7.254]

Contains the most interesting tools of the german PD-scene, most of the GNU
programs ported to the ST (including ports of emacs and bash and an extended
version of bammis library for gcc) and also ports of software posted to
comp.sources.unix, alt.sources and comp.sources.misc.

For anonymous FTP in Europe: archive.cs.ruu.nl
[131.211.80.5]

How to get ATARI-ST/index from the archive at
Dept. of Computer Science, Utrecht University:

NOTE: In the following I have assumed your mail address is john@highbrow.edu.

Of course you must substitute your own address for this. This should be
a valid internet or uucp address. For bitnet users name@host.BITNET
usually works.

by FTP: (please restrict access to weekends or evening/night (i.e. between
about 20.00 and 0900 UTC).

ftp archive.cs.ruu.nl [131.211.80.5]
user name: anonymous or ftp
password: your own email address (e.g. john@highbrow.edu)
cd /pub
don't forget to set binary mode if the file is a tar/arc/zoo archive,
compressed or in any other way contains binary data.
get ATARI-ST/index

by mail-server:

send the following message to
mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

BITNET users:

LISTSERV@UOGUELPH.BITNET

Mail messages with the contents HELP will bring you some usage information
and GET INDEX PROG-A16 will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

ARCS
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are
binary files which may contain one or more other files in a compressed format.
Archive files usually take up less disk space, and for this reason have
become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive
program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

These programs are all available via FTP from the atari.archive server, in the
/atari/archivers directory. Recommended files are:

arc.ttp - needed to extract the other archivers, once.
arc_602.arc - latest version of ARC, with the most fancy features

and quite a lot of documentation
lharc.arc
zoo_bin.arc

Julian Coleman recently (December 1990) uploaded an archive starter pack to the atari.archive server. His announcement reads:

" I have just uploaded an archive starter pack to Atari.Archive. It contains the following :

arc / lharc / uud / uue / zoo
U. Michigan monthly posting (05 Dec 90)

The file is 'starter.tos' and is in the form of a self-extracting lzh archive, so only needs to be downloaded (in binary mode !) and run. The archive contains sudirectories and needs about 350k when extracted."

This is probably the easiest way to get hold of the various archiving programs if you have access via FTP and can transfer the binary file to your Atari ST. The program is located in the main directory (ie. /atari/starter.tos)

There are also several GEM programs which act as 'shells' for the archive programs. The most popular are Shareware offerings, also available on atari.archive server. They are:

arcgsh35.zoo - written by Rainer Klute. e-mail will reach him
at klute@irb.informatik.uni-dortmund.de or
klute@unido.uucp, or klute@unido.bitnet

arcshl25.arc - written by Charles Johnson

Both are located in /atari/archivers

The GEM shells are recommended for inexperienced users (and appear to be quite handy for the experienced user as well!) They require a copy of the archive program -- in other words you need BOTH the GEM shell *AND* the archive program in order to use the GEM shell.

Documentation on the use of the archive programs should accompany the archive files mentioned above. To use ARC.TTP in order to extract these files, use the command line:

xh xxxx.ARC *.*

where 'xxxx' is replaced by 'arc_602', 'zoo_bin', etc. For example

xh arc_602.arc *.*

will place all files within the arc_602.arc into the current directory. It assumes you've clicked on the ARC.TTP program from the Desktop and have the parameter dialogue box on your screen.

In many cases, simply typing a '?' or 'h' will provide an extensive list of available options.

Source and binary code for archive programs have also been posted to comp.sources.atari.st and comp.binaries.atari.st. They are available via e-mail through the panarthea archive server. See Steven Grimm's posting for more information on how to obtain files from panarthea.

ERR
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6

Unknown device.....-15
Bad sectors on format.....-16
Insert other disk.....-17
Invalid function number.....-32.....1
File not found.....-33.....2
Path not found.....-34.....3
No handles left.....-35.....4
Access denied.....-36.....5

```
Invalid handle.................-37.............6
Insufficient memory............-39.............8
Invalid memory block address...-40.............9
Invalid drive specified.........-46............15

No more files..................-49............18
Range error....................-64............33
Internal error.................-65............34
Invalid program load format....-66............35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs

```

PAINT
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

GDOS
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of
STart, volume 1 number 1 said...)

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and
more)" by Douglas N. Wheeler from the atari.archive server. The file is
/atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server.
The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files
or font files (at least those supplied by Atari). You can get these files
with many commercial programs, such as Degas Elite, WordFlair, etc. You might
also want to check your local user group to see if they received a copy of the
WordFlair demo program (also available on GEnie). The demo program appears to
have the GDOS system and font files.

CLI
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor
BASH GNU Bourne Again Shell - available under MINT
ksh Korn Shell - available under MINT
gemini MUPFEL is the shell used by the gemini environment
okami a German shell with many useful utilities built in
pcommand an MS-DOS-like shell

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

TEX
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.0) has recently been made available on the atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the minimum files needed to get a working TeX/LaTeX system up and running on the Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

LANG
Public Domain/Shareware languages...
==========

Check the atari.archive server under /atari/languages. Currently included:

abc
apl Demo and 'J' j_29.arc,apl68000.arc
forth Don't know which, I prefer BRADLEY FORTH
FORTRAN77 BC-FORTRAN version 'C' bcf.lzh
icon ICON icon2.arc,icon_bin.arc
modula-2 From Germany modula2.zoo
Sozobon C Most excellant
Elan
xlisp
xprolog
xscheme

GNUC
Is GNU C available on the Atari ST?
==========

You can also get the GNU C program, which runs on 1 megabyte Atari ST systems. For more than minor programming, you may need to upgrade to 2 or more megabytes, as the GNU programs generally assume you've got plenty memory.

GNU C for TOS is available via anonymous FTP on atari.archive. It is also available via anonymous FTP on cs.uni-sb.de [134.96.7.254] and most of the other European FTP sites.

How do I set it up once I get it?
==========

I just spent a bit of time putting the gcc compiler on my hard drive. I tested it using the good old reliable 'hello.c' program. Here are the notes I made with regard to installation:

The following files were FTP'd from the atari.archive server:

/atari/gnustuff/tos/gcc139b.lzh

(current file [as of 7 May 91] on atari.archive has a corrupt GCC-CC1.TTP)

/atari/gnustuff/cc1-139.zoo

(good copy of GCC-CC1.TTP)

/atari/mint/mntolb8.zoo
/atari/mint/mntinc8.zoo

(you -might- want to use it with MINT, so why not?)

1. Extract all files EXCEPT 'gcc-cc1.ttp' from GCC139B.LZH (the file is corrupted in the current version on atari.archive). Place the files in \EXEC and set the environmental variable GCCEXEC to point to the directory.

2. Extract 'gcc-cc1.ttp' from CC1-139.ZOO and place the file into \EXEC.

3. Extract all files from MNTOLB8.ZOO. Place the files in \LIB and set the environmental variable GNULIB to point to the directory.

4. Extract all files from MNTINC8.ZOO (including subdirectories!). Place the files in \INCLUDE and set the environmental variable GNUINC to point to the directory.

Add the following aliases to your CLI's autoexec file. The following lines come from a slightly modified 'gnu.g' which came with my release of the Gulam shell. Check your CLI docs for differences in how environmental variables, etc. are set!

gnu.g
```
----- cut here ------
unalias cc
unsetenv TEMP
#
# set up commands for gcc and gas
#
alias cpp d:\exec\gcc-cpp
setenv cpp d:\exec\gcc-cpp.ttp

#
# General
#
setenv GNULIB d:\lib
setenv GCCEXEC d:\exec\gcc-
setenv GNUINC d:\include
setenv TEMP g:
------ cut here --------
```

OTHER FILES YOU MIGHT WANT/NEED:

FLEX.ZOO - lexical analyzer
BISON.ZOO -
DOCUMENTATION.ZOO - some nice-to-have documents in TeX format
DIFF115.LZH - can handle binary files as well as ASCII files
RCS5AP1B.LZH and RCS5AP1M.LZH - Revision Control System
GULAM.ARC - one of many CLIs which will work with gcc

Like I said, I successfully compiled a program using the above procedure (and I didn't have bison or flex or the documentation or RCS or diff...) so it is the minimum you need to do to get going.

If anyone has corrections, additions, suggestions about these directions, please send me e-mail so I can incorporate them into the next 'welcome to comp.sys.atari.st' ... I'll be working on minimal TeX / LaTeX instructions

next.

FREE
What is Free-Net and how can I get access?
==========

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor.

Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to myself via the e-mail addresses above or by writing the SIG at its US mail address:
The Atari SIG
P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout the world. We look forward to seeing you all real soon! Remember the staff of the Atari SIG are volunteering their time for no pay and the Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization existing for the free exchange of information.

MINIX
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)

- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.

If you want to follow the MINIX discussion, read the comp.os.minix newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

DEV
How do I become a developer for the Atari ST?
==========

Contact Gail Johnson, Atari Rep Person, (408)745-2568

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you desire.

Atari has gone to a 2-tier developer membership. The 'higher quality' developer support goes to commercial developers, and costs $250. The 'no-hand-holding, no announcement of company future products, no access to discounted hardware' goes to noncommercial developers, at an initial cost of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill in an application form and a non-disclosure agreement. Contact Gail for more information.

ZNET
Where can I get copies of ZNET?
==========

ZNET on-line magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

ZNET and some information from the Current Notes user magazine are also
available from the atari.archive server under /atari/magazines.

PALS
ST Pen Pals list
================

Simon Chappell is compiling a list of people interested in exchanging
paper-based mail "of interested parties who could then
keep in touch and prevent themselves losing touch with the ST community
at large (this would be especially easy if someone who still had net
access could summarise current topics or forward news and advice!)"

He is accepting entries in this format:

eg Simon Chappell.
s61304@uk.ac.psw.pa (NOTE: NO LONGER VALID ADDRESS...)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

Contact Simon at his paper mail address if you are interested.

MAGS
What magazines are available for the Atari ST?
==

The information here is preliminary. If you've got updates, mini-reviews,
or more information on other magazines, please send them to me via e-mail.
As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free
[$6.00/50 magazine shipping charge] from participating computer dealers,
bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class (there is
currently a $15.00 introductory subscription available for a limited time).

Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may
subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year)
Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine
(Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

Subscription costs: UK - 15 pounds; Europe - 18 pounds (Air Mail); worldwide - 28 pounds (Air Mail)

Address: ST Club, 49 Stoney Street, Nottingham, NG1 1LX ENGLAND

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90. Now, allegedly, about to be revived as a monthly (under the stewardship of Jean Gollner, mother of ex-editor Hugh) in the wake of Atari UK's new push into the 'serious' market.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people. Lively, but of uneven quality. Big leisure section, but other areas covered too. Includes cover disk - mix of games demos and (usually out of date) PD utilities. Probably the biggest-selling UK ST mag. Has had several public rows with Atari UK.

Atari ST User:
---

like ST Format. Generally (amongst online users) thought to be not quite as good.

ST Action:
---

games, games and more games. And games.

There are ST sections in New Computer Express (weekly), Computer Shopper (monthly) and some general-purpose games mags whose names I forget.

There are also, I think, some MIDI mags with strong ST content. I don't have their names.

German Mags:

Atari PD Journal:

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this information, DP-Z]. Hardware and Software reviews, some commercial software reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100 Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Markt & Technik Verlag AG, Hans-Pinsel-Strasse 2, D-8013 Haar bei Muenchen GERMANY

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

TIPS
TIPS AND HINTS from other users
==============================

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to drive B. Handy when a program 'hard-codes' the data drive, and you wish to use your hard drive instead. (It is available on the atari.archive server.)

1298. TT memory (was allocation)

Newsgroup: comp.sys.atari.st
Date: 1991-07-15 13:56:49 UTC
From: ralph@laas.fr
Message-ID: <RALPH.91Jul15155649@orion.laas.fr>
Source record: 230094
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am considering upgrading to an Atari TT. As I understand it TT's
only come in two models: the TT/2 and the TT/8. Is the ST RAM *only*
on the mother board, or is half of it on the extra TT RAM card?

Also what kind of RAM is in the two types of RAM for the TT: SIMMs,
SIPs, chips, or some mixture of the above? I would prefer getting a
TT/2 and upgrading the ST RAM to 4 Mb in the case that SIMMs are
involved. I would probably later on, sometime next year when the
European plant for 16 Mb chips starts operation, get the faster TT RAM
when prices would fall.

Really Greg, you should not use this newsgroup to slam Atari, especially when you don't know what you are talking about. The GEM desktop may not be great, the the interface works great in programs. It is fast and has a nice menu system. As for you comments on Atari D.T.P. programs, from you posting it looks as if you have never used them. I OWN A DTP COMPANY, I STARTED WITH MAC SOFTWARE. You probably have not had this experience, if you have I would like to hear about it. As for complex documents, I just described one of them. I do good work, I like it and it satisfies my customers. Paul, owner of the other ATARI based DTP here Columbus does absolutely wonderful stuff, it is honestly just about the best work I have ever seen done on any system, far better than mine really. I just can't do his work justice, you would have to see it to believe it. Both of us do lots of work, our customers are professionals who demand good work, we do complex work, we do long and extensive documents, etc., just like Mac users do. Sure, we have different font formats than does the Mac, and different printer dirvers etc., but show me output from a Mac to a 300dpi printer anywhere close as good to what I get from Calamus (by the way, you can't, like I said, I've used the software and I know). If you want to read the advantages of some of the Atari Software, go back and read my original post, but actually pay attention. I don't think the users of this Newsgroup mind constructive comments, comparisons etc., but you have not offered that, just a few opinions about something you seem to know absolutely nothing about. Please post a follow up describing the process by which you arrived at the conclusion

that Paul & I can't be doing what we're doing with the system we are using. If you know some good features the Mac software offers that the Atari Software does not, please let me know, you may even talk me into changing, I'll do what's best for my company, but you will have to use real FACTS and experience , not just unsubstantiated opinions.

Wow, you again, well, all I can say is, I've used it all. I also work as a computer consustant for ACS here on the OSU campus, and I have to know all the systems, we even had two Amigas until a few weeks ago when the went to the Graphics lab. I'm perfectly satisfied with the GEM interface and I still have TOS 1.2 in my Mega. GEM has advantages and disadvantages, but so do all the systems. I honestly like using them all, and don't really dislike any of them all that much. None of them are perfect, and you can't expect them to be. By the way, if you don't own an ATARI, what are you doing here?

the PBM plus system has been ported to the ST. available from atari.archive (in printing/pbm, as i recall, a rather odd place for it). it should convert PI3 -> internal format -> GIF with relative ease. here relative is the operative word: i just started using it yesterday on the ST. unfortunately, unless you have a shell which makes stdout a binary file (meaning don't convert newline to cr-linefeed), you may run into problems. i did. however, if you make a utility to change all cr-lf into just lf, you will be ok, most of the time.

pbm is too big to send. get it on your own from a.a. it is not a single program, more like a library of general purpose utilities (lots of them) to manipulate images of various formats. as far as i know there is no support for TIFF, however, which is somewhat suprising.

What would Commodore gain from this? In all seriousness, I think getting involved with Atari in the same manner as IBM-Apple wouldn't gain them anything except increased debt. Commodore seems to be getting on its feet, both financially and technology-wise, all by itself. In short, I think the vast majority of the benefits for such a union would go in one direction Commodore >>> Atari so Commodore would have no incentive to seek such a union.

Cheers,

Chris

1305. Running a dual TOS system

Newsgroup: comp.sys.atari.st
Date: 1991-07-15 15:28:13 UTC
From: steveg@cseic.saic.com
Message-ID: <3096007@MVB.SAIC.COM>
Source record: 230328
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've just installed Wizztronic's compatibility plus board in my Mega 4, and
now have both TOS 1.0 and 1.4 available at the flick of a switch.
Installation was straight forward (only 1 wire to solder), but now I have
the following problem:

TOS 1.0 can only handle hard disk partitions up to 16MB, but since
I've been running 1.4 for some time now, I've got a number of 20+ MB
partitions. 1.0 seems to be able to READ data from these partitions
ok, so long as it resides below 16MB. Anything above the 16MB level
on the partition appears scrambled. I don't dare WRITE to such a
partition under 1.0. I'm thinking about repartitioning my drive using the 'new'
BGM scheme (larger cluster sizes), but otherwise keeping my partition
sizes the same.

Does TOS 1.0 support BGM partitions?
Will this let me get past the 16MB limit?
What problems might occur by using larger clusters?

(I've got an ICD Advantage host adapter with version 4.x.x software,
though I just downloaded the 'latest' v5.x.x)

I think the technology sharing aspect of this deal was secondary. IBM
is probably doing this to avoid wasting time/money on litigation with
Apple over their "Maclike" GUI in OS/2.

Cheers,

Chris

The "real" PBMPLUS distribution does support TIFF in all its glory. If the version on atari.archive doesn't, it's either abridged or old.
Wish I could remember where to FTP the latest version, but I can't. :-)
Anyone interested in getting the latest version should read the FAQ for comp.graphics or read alt.graphics.pixutils.

From: ralph@laas.fr
Message-ID: <RALPH.91Jul15180231@orion.laas.fr>
Source record: 230089

I have had *NO* troubles using MACCEL3.PRG with XCONTROL on my Mega 4 ST. It even puts some gibberish (non-ASCII) in the cookie jar. I have upgraded from MOUSTRIP.PRG, to MACCEL2.PRG, to MACCEL3.PRG. I believe that MACCEL3 is just MACCEL2 with some XCONTROL, cookie jar stuff added on, right Allan? With MACCEL3, SYSINFO tells me that MACCEL2 is installed. In order to use MACCEL3.PRG you also need MACCEL.CPX. When I first installed XCONTROL I left MACCEL2 lying around and that caused the system to freeze up!

Good luck to all,

>

While everyone is presenting wish lists, how about a spooler that tests the size of a spooled file, mallocs enough memory, then shrinks itself when the file has been printed. Is this possible? Frankly, I would be happy if I can find a spooler that can simply handle binary files.

Here is some more stuff on my wish list, but I doubt that anyone can produce these in a week. Maybe some adventurous soul with lots of free time is looking for an interesting project. I doubt that any of these wishes will ever come true, but ...

1) Some kind of flow-chart generator. When porting software to the ST, it would be nice to be able to have a program produce a flow-chart which reveals the general structure of the software to be ported. This would also help programmers examine the structure of their own programs. Graphical output and ability to dump to a printer would be nice. Even a subroutine calling tree would be useful.

2) A really neat project would be a clone of the Sunview libraries (say for GCC and MiNT) based on GEM (or maybe MGR). Then lots of PD Sunview programs could be ported to the Atari with little effort. This would add lots of nice graphical programs to the ST domain. Also, Sunview seems easier to program than GEM, so it could be used as an alternate ST programming environment.

3) A GEM version of Tooltool would also be really neat. Tooltool is a PD Sunview program that allows ordinary code to be embedded in the Sunview GUI WITHOUT having to modify the program or know anything about Sunview. (I suppose everyone can tell I use a Sun at work).

4) A graphical interface to one of the PD debuggers would also be nice, something like dbxtool on Suns. One window has the source listing with an arrow pointing to the current line. Break points can be selected with the mouse, etc. By the way, do any of the commercial C packages have anything like this?

5) A WYSIWYG postscript editor is the last (and most unlikely) item on my list. I don't think one of these exists on any platform.

From: tzeng@sunland.gsfc.nasa.gov
Message-ID: <TZENG.91Jul15132134@sunland.gsfc.nasa.gov>
Source record: 230334

I know this isn't the "correct" newsgroup but I figure st users to be pretty up to date on Atari products.

I need a pointer to a magazine that sells Portfolios mail order to get an idea of how much they cost. Which Atari mag should I take a peek at?

Any additional info on the Portfolio and any quirks would be much appreciated.

For the Amiga vs Atari flamefest I'll add that I'm considering selling my Amiga for rent and a Portfolio ;-).

Hi Lauren,
Being able to create a RAMdisk at bootup, copying files to
the RAMdisk, then continuing to boot from the RAMdisk; is a great idea!
Although the solution is already commercially available on the CodeHead
Utilities disk from CodeHead Software. CodeHead has just released Version
4.0 of this disk. It has a list price of $34.95, although street price is
around $25 - $30; it is available from your local dealer (if you have one!),
your favorite mail-order or from CodeHead Software directly.
The CodeHead Utilities 4 has lots of new versions of previous
programs and lots of brand new programs (it comes on two floppy disks now).
It also includes the latest versions of the Codehead's collective public
domain and shareware programs; and the updated demos of thier other
commercial works (all of which support the ST/STe/TT's).
No... I don't work for CodeHead Software, but I am a satisfied
CodeHeadian customer! Bye.....

Now this is a really good idea. A printer spooler that shrinks itself to match the size of the file (or expands to a maximum limit) would be really great. Sometimes I want to print something that is only two or three kilobytes, and it seems like such a waste to keep a thirty-two kilobyte buffer. The spooler itself would be a little larger, but the benefits would be fantastic.

Good idea, Timothy! I just hope DC read it and like it...:)

1316. Starving Developers Sale

Newsgroup: comp.sys.atari.st
Date: 1991-07-15 20:17:13 UTC
From: boblu@tekgen.BV.TEK.COM
Message-ID: <8034@tekgen.BV.TEK.COM>
Source record: 230337

**** Newsflash **** Atari Developers Starving ****** Details at 11

Have you heard of starving artists sales? Well this is a starving
developers sale. In order to generate cash to continue operations
I am forced to liquidate some of my excess hardware and software.

Hard disk stuff:

CDC Wren 86 Meg 15ms $400
Seagate 157N-1 49Meg 28ms $225
ICD Advantage Plus SCSI Host adapter w/clock $75
Supra SCSI Host adapter w/clock $65
External case w/power supply & fan $75
If you also get one of the drives only $50
I'll put together any combinations of above in a system loaded with
PD software plus a copy of the latest version of Diamond Back II

Miscellaneous hardware:

External DreamPark PowerDrive 1.44 meg Floppy $200
Includes 60 free HD disks
520ST w/1 meg upgrade $200
Epson DX-10 Daisy Wheel printer $75
Epson MX-80 9 pin Dot Matrix printer $50
Supra 2400 Baud modem w/cable $75
JoppaFAX 2400 modem with 9600 baud FAX w/cable $150

I also have the following software items that I no longer need for sale:

Productivity:
Wordup 3.0 $25
Degas Elite $20
Revolver $15
MiGraph Labelmaker Elite $20
Megamax C $40
G+Plus $10
Neodesk 2.05 $15

Play:
Hero's of the Lance SSI $10
Rings of Zilphin SSI $5
Star Command SSI $8
Warship SSI $10
Red Lightening SSI $10
Storm Accross Europe SSI $10
Wargame Construction Set SSI $10
SuperStar Ice Hockey $8

F40 Pursuit $5
Silent Service $8
Dive Bomber $8
Fire Brigade $10
Spitfire 40 $10
Lombard Ralley $8

All hardware and software items have the original box and documentation.

Terms: First full price offer gets it. I will consider offers through August 1 (I may be starving, but I won't give it away. Listed prices are already at the low end of fair market value). You pay UPS ground shipping and payment is UPS COD cash.

Which version of QuickIndex do you use? QuickIndex compares the result of your
Atari to a 'standard' one running with the *same* TOS. If you can get
QuickIndex 2.x, you can comapare the results to any of the TOS-versions...
But... comparing TOS 1.4 to a TT is frightening... =8-)

They indeed do. They also screw around with lineF in their keyboard
equivalent for dialog buttons utility (i forget the name).

I was wondering why inlined math code would'nt work with a '881 in
co-processor mode. Their acc was the cuprit. I left the autor a
message on GEnie some time ago, dont know if they did something about it.

cheers,

I'm in the opposite position: I'd like a spooler that spooled to disk,
and read back in chunks (eg. 4K) for printing. That would make printing
from PageStream much more pleasant on my 9-pin. I believe the lpr stuff
with MiNT did this.

What are the pitfalls of having a TSR access the disk? If I knew them,
I would gladly write such a spooler.

Warwick.

-> For the record.. TTs use the same technique to change between the five
-> lower
-> resolutions as the ST does between low res and medium res.
->
Oh yea? I would like to hear what allan says about that or kbad or someone from
atari...
A friend of mine who had an St about as long as I did now has a TT and he told
me it DIDN'T reboot between the resolutions except between the 5 color modes
and the high res screen. (NOT when switching between any of the 5 color modes
though..)
(I had one of the first 520st's that had tos in rom... Bought it 3 months
after a guy bought one brand new in the first couple weeks they were available)
He is using a multi sync monitor (19") but it doesnt work right with his TT..
Apparently the thing has boarders in the inches around his screen.. (Much like
a non-modified mono-monitor but on a bigger scale)
He liked the idea of a cheap monitor but atari in thier blazing glory decided
to lock consumers into their monitors unless you want a screwy screen..
(Anyone have an easy fix? He is using a .28 pitch multi synch monitor..)

I work for a company that is heavily involved in CD-ROM publishing equipment.
Frankly, we've seen very little happening in either CD-I or CDTV. Many
companies are just getting into CD-ROM, and those that are already in CD-ROM
seem happy to stick with ordinary CD-ROM.

We've been interested in looking at supporting CDTV. Unfortunately, Commodre
CDTV division seems to have a similar attitude to Atari's developer support.
We can either purchase (through barter) a full CDTV development system complete
with Amiga, or we get nothing. All we want is a specification at this point,
and we can't get it.

I crossposting this article to alt.cd-rom and directing Follow-Ups there, since
my posting has very little to do with Atari (or any particular computer).

1326. Ramdisk assisted booting

Newsgroup: comp.sys.atari.st
Date: 1991-07-16 04:28:30 UTC
From: AAron@sun.soe.clarkson.edu
Message-ID: <9107160428.AA13072@sun.soe.clarkson.edu>
Source record: 230341

I have a 4meg STe, and no harddrive. I didn't realize that others were
dealing with problems like setting up their ramdisks upon booting also...

My solution: a BOOT DISK to create and fill the ramdisk and
a REBOOT DISK to do minimum to restore ramdisk and control.

GEMINI booting with a 2.8 Meg ramdisk

BOOT DISK -- Used on cold boot to get into the GEMINI environment and
set up the RAMDISK file system.

Contains AUTO folder with: Resetable ramdisk program,
GEMINI stuff,
Screen saver,
GDOS equiv. (looks for fonts on A:),
etc...
Contains ACCESSORIES
Contains GEMINI: Program, Fonts, ...
(GEMINI.APP is set from the
desktop as an AUTO GEM program)
Contains MUPFEL.MUP: Sets environment, runs A:LOCAL.MUP
(NOTE: Calls LOCAL.MUP on FLOPPY)
Contains A:LOCAL.MUP: Creates Ramdisk file system,
Copies files to ramdisk
(Including all of GEMINI),
Uncompresses files to ramdisk
(To save LOTS of space on floppy)

REBOOT DISK -- Warm boots quickly since ramdisk is already set up
with GEMINI and any other applications. Still has ACCs
and \AUTO. Used if STe ever crashes.

Contains SAME FILES AS BOOT DISK with the following diffs:

GDOS looks for fonts on RESET PROOF RAMDISK,
GEMINI files are not on floppy,
GEMINI.APP in the RAMDISK is set from the desktop as AUTO GEM,
A:LOCAL.MUP contains no file system creation commands

MiNT/MGR booting with a 2 Meg ramdisk

BOOT DISK and REBOOT DISK follow the same concept of GEMINI disks.
My MiNT boot disk creates a Ramdisk file system, sets up environment,
unarchives \BIN (which contains BASH among other things) and \MGR,
then runs mgr...

Leaving me in a system where I can pop the floppy and be functional without it.
(I end up with GEMINI/MGR, BIN stuff, EMACS and UNITERM/MGRTERM in ram)

AAron nAAs |\ \ Ptht...
'O.o /
Disclaimer: Beware of my ego =( )()=
AAron@sun.soe.clarkson.edu U

P.S. Doesn't the most recent SI Ramdisk DA allow you to create ramdisks,
copy files to them on boot, and has print spooler stuff? Plus there
are a few programs that you can put in the autofolder and read a
data file for info on what to copy where.

1327. 3D Animation/Lexicor

Newsgroup: comp.sys.atari.st
Date: 1991-07-16 04:31:44 UTC

Message-ID: <1991Jul16.043144.20224@magnus.acs.ohio-state.edu>
Source record: 230340

Has anybody heard of a company called Lexicor Software? They
are producing a 3D package called the Phase-4 Animation system
for the ST as well as a 24 bit graphics card. Any info, like
their address or articles in magazines about their product,
would be much appreciated.

1329. Wanted - info on Mega ST 8/16 MHz accelerators

Newsgroup: comp.sys.atari.st
Date: 1991-07-16 04:38:38 UTC
From: jerzy@leland.Stanford.EDU
Message-ID: <1991Jul16.043838.5402@leland.Stanford.EDU>
Source record: 230262

Hello,

I'm considering buying an accelerator for my Mega ST2, but first I'd
like to ask more experienced users, which of the accelerators currently
available (from Gadgets by Small, Fast Technologies, ICD Inc.; are there
any more?) is the best ? In particular I'd like to know the following:

- how easy it is to install a given accelerator;
- what is the effective gain in speed (for computations,
graphics, etc);
- limitations (what programs won't work);
- is it really worth the price.

Besides, are T20 trustworthy ? What warranty comes with them ?
I'd really appreciate comments on the above.

Thanks in advance,

1336. Reset-Proof Ramdisk

Newsgroup: comp.sys.atari.st
Date: 1991-07-16 14:18:37 UTC
From: malay@sae.com
Message-ID: <1991Jul16.141837.26047@sae.com>
Source record: 230258

I'm looking for (either PD or commercial) a reset-proof ramdisk that will run on a 4Meg 1040Ste without bombs. I tried the eternal2 from a.a and I get two bombs. I then tried eternal from ST-Format and it gave two bombs.

I have a commercial piece of software that gives me bus errors when it is run on the 4MB STe - if I run it on a 1MB STe or a 1MB STf it works fine. I've run all kinds of memory-intensive stuff without problems so I'm assuming there's a bug in the commercial piece of software. Is there another way I can "fool" this program into believing I only have 1MB (short of yanking the SIMMS). I thought that if I would set up a 3MB reset-proof ramdisk and warm boot the buggy software that it might just work????

What you ask for is available now.

It is called DC Shower and includes many enhancements over the original
DC Showit.

For a limited time only (until August 1), you can order DC Shower from us
by phone and get DC Shower for 1/3 off just by saying:

SHOWER POWER

Or, if you prefer to do it by mail, you can send a check for $22.95 (which
includes shipping and handling charges) to:

SHOWER POWER
c/o Double Click Software
PO Box 741206
Houston, TX 77274-1206

DC Shower is compatible with all Atari ST/STe/TT systems and includes modules
for text, pictures (17 formats), digitized sound, hex viewing, ARC, LZH, ZIP
and ZOO extraction.

Additionally, it works _directly_ from UIS 3.3 (if you select SHOW from it)
or can be used as the Alternate Text Viewer from NeoDesk 3.0 using the
supplied DC Pick program (which accepts a file parameter or runs as a desk
accessory so you can view files from within GEM programs).

>

I was wondering if you or someone else had posted this question already. So, since there was no answer yet, I'll try: I have NeoDesk 3.? with TOS 1.0 and many other programs in my AUTO folder along with half a dozen accessories starting up at boot time. Initially, I couldn't get FATSPEED running (I think that was with my old version of NeoDesk 2.?). Just recently I read a post, from this net I believe, that mentioned to put FATSPEED first, even before PINHEAD. Well, now everything is working fine and FATSPEED helps out a lot, especially since my hard drive (Supra 30M) is near full. Maybe your HD has problems(?). Possibly, someone else can shed some light on this problem?

> I would gladly write such a spooler.

I think that Malloc() and file handling share the same primary pitfall,
which is that under GEMDOS, only the current process may ``own'' either
dynamically allocated memory or file handles. If the current program
terminates, the memory and file handles will be invalid.

If this is the case (and I'm not a developer, but merely repeating what
I've been told on the net), then the method that Timothy suggested
couldn't work -- at least not with Malloc(). There might be a workaround
using high memory, or there might not.

The way around the file handle problem is fairly easy -- open a file,
read a chunk, and close it. Keep track of where you are. Then reopen, seek
the old position, read some more and close. Be sure that you never allow a
task switch while a file is open. (If you're a DA, beware of AES
functions.) That way you could keep replenishing a static buffer without
running a risk of losing a file handle.

In 1985, when the ST came to market, a monitor capable of displaying all
three resolutions would have cost several times as much as the computer.
You can buy such monitors now, but they compromise the quality somewhat.

From: kbad@atari.UUCP
Message-ID: <2992@atari.UUCP>
Source record: 230280

ford@tardis.computer-science.edinburgh.ac.uk writes:
(several programs tried out on the TT didn't work, most were games)

As far as TT compatibility is concerned, games are risky at best.
Disk-based copy protected games are almost certain to fail. The
main reason for this is the use of timing instruction loops.
As you mentioned, some games go too fast. The same applies
to the tricky timing they try to (wow, alliteration) make copy
protection work.

Something else you could try for non-bootload software is running
24BIT.PRG in your auto folder. This won't help for software that
relies on CPU instruction timing for timers, or for software that
installs its own exception handlers, but it will let you run programs
that aren't 32-bit clean. GFA Basic programs compiled using
all but the more recent versions of their compiler have this problem.

|PS. Should the TTs internal speaker sound as if it's blown?

No, but it does sound quite tinny. It's quite a low-fidelity speaker.
Try plugging your TT into your home stereo with some RCA jack cables. Whee!

|don't know which program in my boot sequence was causing the problem.
|Does xcontrol locate maccel3 using the cookie jar...?

Yes, the Mouse Accelerator CPX finds MACCEL3 by looking for the cookie
installed by MACCEL3.PRG. If the CPX is unable to find the TSR, then
something in your boot sequence is probably screwing up the cookie jar --
a *dangerous* thing in STE's & TT's. MACCEL3 should be able to run
anywhere in the auto folder, in fact you can even run and install it
from the desktop.

Someone mentioned that MACCEL3 had problems with DC Showit? Hmm...
MACCEL3 is very compatible with a lot of stuff, I'm curious what the
conflict with Showit is...

Being a Portfolio owner with limited FTP access but no mail privileges at my site, would it be too much to ask that this be posted to some archive? Say, atari.archive in the /atari/portfolio directory.

Is this already being archived at atari.archive (a la STReport, Z*Net etc.)? Or some other archive site (since PORTABLE ADDICTION is not strictly Atari related)?

If not, is it a good idea or not?

brad

Source record: 230277

Just two quick questions...

I noticed someone awhile back mentioned Ghostscript (postscript viewer) for the ST but haven't seen it anywhere. I'm almost sure he said it was at atari.archive.... Anybody seen it?

Second, I'd like to know if there exist any guides of the format of IMG and GEM files. I've looked, but to no avail.

Jon

Mine works. Don't know what the problem might be.

>MiNT 0.8 Works fine (except for the exception handling).

Known bug, I fixed it & sent Eric the fix.

>GNU CC 1.37.1 Everything works except the preprocessor, which doesn't parse
> #if blocks properly.

Mine works -- are you SURE this is a TT/ST difference? GCC from Bammi has
always been pretty robust, and certainly has always worked fine on the TT.
It compiles itself, which is a pretty thorough test.

A friend of mine ordered ICD's accelerator and found it awefully
hard to install, he had a guy at work who does DEC field work install
it for him.

It failed, appearently ICD sent them a bad 68K-16. So, he sent the whole
machine to them, they worked on it ($30 bucks an hour!). They couldn't
find out what was wrong so they did a complete reinstall of the board
and last I heard they were shipping it home to him.

My MEGA STE is pretty peppy at 16Mhz, I haven't had the chance of
doing anything with both machines.

I'll let you know though, in about a week I am going to see him.

As I said before, I don't recommend the 20Mhz 68000 upgrade.

Stay away from it.

Most ST's have trouble running just at 8Mhz

Well, the time has come to back up my disk (I am currently running the typical irreplaceable-data-and-no-backup algorithm). I have seen Diamondback II and I also have BackupST (the one written by F. Appelman, which consists of backupst.ttp and bfront.prg as a front end). Now, to the questions . . .

First of all, I seem to remember a few posts awhile back about some problem encountered with BackupST. Since there are at least three programs of this name, I am unsure if it is the one that I have (which looks very complete and well thought out, by the way). Could someone post/email a summary?

Also, can anyone recommend one product over the other? Anyone used them both?

I am having some problems with archived files. Maybe someone can help...
- I got the archived stuff (and accompanying programmes) from atari.archive via ftp using my UNIX account, transferred it to 3.5" low density floppies formatted on a PS/2 ('cause I don't have a modem, and that's what's in the I/O room here at school to allow you to get copies of things)
- I got a copy of starter.tos (using binary and ascii modes, just in case) and ran it, but both of them gave a TOS error (#35 I think; one of the ones in the list that are undocumented)
- I also tried arc.ttp with a command line similar to above, and all that happens is the screen blanks (goes white, with the cursor in the upper left) for a few seconds, and then it returns to the directory list. This result was only after playing around with things for a bit and discovering that we needed arc.ttp on the same floppy as the file to be un-arced (we tried replacing the disk with arc on it with the disk with the arced file on it when the dialogue box came up, but it kept saying "Cannot open application" or some such). It doesn't matter which parameters are passed (even none). The result is always the same. (We also tried "?" and "h" to get help, but none was forthcoming.)

Anyone have any suggestions. I am completely lost.

Something else which might have a bearing on this (I'm not discounting anything at this point) is the fact that we tried using the version of zoo I have for my 386 on one of the .zoo files I got a copy of, and it hung my computer. This .zoo file has been around several disks, though (from the one I made on the PS/2 to one made on the ST, read onto the UNIX partition of my hard drive ('cause DOS couldn't see anything on the disk), back onto a floppy formatted in DOS, and then read onto my DOS partition). Could it be that all the floppies I made on the PS/2 are funny in some way that the ST hates?

| I'm looking for (either PD or commercial) a reset-proof ramdisk that will
| run on a 4Meg 1040Ste without bombs. I tried the eternal2 from a.a and I
| get two bombs. I then tried eternal from ST-Format and it gave two bombs.

The latest CodeHead Utilities contains what has to be the absolute coolest ramdisk around. Not only is it reset-proof and bug-free, it works properly with POOLFIX after a reset (e.g. POOLFIX doesn't bail out because it found the ramdisk got there before it did). And, with this ramdisk you can install a second ramdisk drive, which can be used as a reset-proof print spooler!

There's also about a jillion other features for this ramdisk that I'm not too familiar with, 'cuz I don't need 'em.

Disclaimer - I'm just a happy CodeHead customer, is all!

The installation of ICD's accelerator is easy for a competent technician with the proper desoldering/soldering tools. Unsolder the 68000, solder in a socket, plug the AdSpeed in the socket. However, the installation IS the equivilant of a brain/heart transplant and doing this job without the proper tools and experience increase the probability of damage to your machine. Do not attempt it alone if you have ANY doubts about your soldering capabilities.

It took me about 40 minutes to do the installation and it has worked wonderfully. I did have the advantage of access to a very nice vacume desoldering/soldering station to do the job.

>As I said before, I don't recommend the 20Mhz 68000 upgrade.

>
> I would like to see a .ttp version of DCShowit for us Neodesk users.
> DCShowit is by far the best ASCII file viewer for the ST (IMHO), and I miss
> it!!

I agree that DC Showit is a fine file viewer, and as a confirmed NeoDesk addict I miss it too. I think I read somewhere that DC have now put out a commercial release, called DC Shower (easy to confuse with a way of cleaning yourself, but I guess there's a limit to the number of <=6 character combinations to follow the letters DC).

No doubt someone else can remember the price and availability details.

It would be nice for some magazine to compare all the various offerings, including Doug Harrison's Lookit! and 101 PD alternatives. For the moment I'm sticking with Moshe Braner's MORE.TTP, which is not quite as comprehensive or convenient as some others but works fine with a hard disk and judicious use of 'install application'.

Graham

1362. exception vectors on TT

Newsgroup: comp.sys.atari.st
Date: 1991-07-17 10:33:00 UTC
From: Martin_Gaeckler@m.maus.de
Message-ID: <11408@m.maus.de>
Source record: 230237

Hi vic,

your solution is too simple. The Problem is, when the cpu returns from the buserror handler, it will try again the instruction which caused the error. Therefore your program stays in an endless loop.

Now You have to remember, why the buserr exception is caused.

1. You try to acces to protected memory area.
Solution: Goto Supervisiormode (use Gemdos-call Super)
2. You try to access memory not installed.
Solution: I'm sorry I don't have a quick solution.

Hope this helps.

Greeting from bavaria.

Martin

1363. TT memory allocation

Newsgroup: comp.sys.atari.st
Date: 1991-07-17 10:33:00 UTC
From: Martin_Gaeckler@m.maus.de
Message-ID: <11409@m.maus.de>
Source record: 230238

Hi Martin,

You asked how to set the special TT-Bits in a prrogram files's header.

What you need is the header's structure:

```
typedef struct
{
int magic;
long textSegmentSize;
long dataSegmentSize;
long bssSegmentSize;
long SymBolSize;
long resv1;
long fastLoad; /* this is the long value what you need */
int resv2;
} PH;
```

Following the special flags of TOS 1.04 and TT-TOS:

```
#define NOHEAPCLR 0x01 /* Do not clear program's heap */
#define FASTRAMLD 0x02 /* Load program to TT-Fastram */
#define FASTRAMMA 0x04 /* Program's malloc to TT-Fastram */
```

```
ph.fastLoad |= bitSet; /* Set the flags */
ph.fastLoad &= ~bitClr; /* Clear the flags */
if( heapSize != -1L )
{ /* Set the required heap size */
curHeap = heapSize + 128L * 1024L -1L;
curHeap /= 128L * 1024L;
*((char *)&ph.fastLoad) = (char)curHeap << 4;
}
```

Hope this helps.

Greetings from bavaria

Martin

>>the print-layouts for both MEGA STE and STE to do this, the chip is called
>>GSTSHIFTER and has to do with both video and sound in the STE machines..)
>>I would again like a comment on this from Atari Corp. You can't just ignore
>>this problem that applies to a great number og MEGA STE's !!!!!???

The same problem on my machine:
Switching to another screen in the DEVPAC assembler or in SPECTRUM 512
has the same effect. If Atari does not believe in that, why dont they
test it?
Where can I get the chip, that Lars-Erik described. Is this a custom chip
or any other chip.

DMA-Sound: in low resolution it`s the same on my machine. While accessing
the harddisk there is a terrible noise in the loudspeaker. In some programs
this occures also when I move the mouse.

After all these articles on the net, ATARI still claims this would be an
error only on our machines. So if anybody on this net reads about this and
if his machine works fine, could he please send a short mail?

Thank you , Christian.

I had a Hypercache 16 Mhz card with 8 KB cache in my MEGA ST4
Installed it my self and it worked great. It's easy to switch 8/16 too
(the earlier posted SPEED.PRG let you do it from the keyboard...)

This is the first person I've ever heard from that has had any problems with ICD or AdSpeed. I can highly recomend one, I've got one myself. It took my dealer less than 1 hour to install (25$!), and he reported that the installation was wonderfully easy. Also, AdSpeed will switch to 8mhz. automatically with a settup file, which I believe the MegaSTE will not do. Of course with AdSpeed you don't get the Stereo sound etc... But neither do you get that MegaSTE keyboard, the original MEGA keyboard is far superior, the MEGA STE keyboard even looks cheap (I was very dissapointed, as was my local Atari shop, so far that keyboard alone has lost them two sales, myself and an employee of the store). I have heard rumors of the 20mhz board, and unless there have been improvements in the 68000, they should burn out much faster then at 16mhz, I guess it depends on how long you intend to keep your computer. As for "most Atari's having proplems just running at 8mhz", all the speed tests I've done show my MEGA with tos 1.2 being 99.5% as fast as the MEGA STE, so I have no complaints. Obviously Gadgets 33mhz board does not have problems, so I can't understand what information this comment is based on.

Well from what I have seen the HDU from Application Systems Heidelberg
would be the best one I have seen, but that was Version 2.2A,
I believe that its upto Version 3.x, very easy to use, does not use
a normal Tos format, only one file per disk, the Full Directory is
held on the Last disk, but can't be seen by Tos..
Disks do have a Tos File ID, Disk No. Partition etc.
You have complete control of the Files to back up, and Restore.
Mask/Date and Archive bit.
Uses Gem a lot.
I have seen and used most of the Otheres, what we need is for some Demos
posted to the Archive.

I think that was me, DC show was getting corrupted some how,
Tos error 35, if I remember, removed MACCEL3, no more problems,
I did read some thing about corruption problems on Genie some time back..

Burn out? As long as your machine keeps cool the IC's should last
indefinitely. Is this 20MHZ 68xxx attached to a heat sink? You might
want to look into one of those if you're having heat problems with the
chip itself (although I'd much rather have a fan).

I was wondering if there was anyone out there who was really into assembly coding and had maybe written a couple of demo screens. I am in need of some help in coding, I am just starting to code. Also, any help getting started using MonST would be appriciated. Using electronic mail is the best way I can get help, please contact me through the above address and send me sample code, etc...

I have already learned some basics on my own, like raster interrupts and sine wave sprites, just basic stuff. I want to get into complex coding, but I really would like some help.

Any help would be GREATLY appreciated.

>atari.archive.... Anybody seen it?

This question sounds like a good opportunity to tell everyone that GS 2.2 for the ST will be available soon (I hope to upload it this weekend). If you are thinking of downloading GS (a rather lengthy proposition), you might want to wait for 2.2. Version 2.2 fixes various GS bugs and supports improved fonts.

In addition, the ST version of 2.2 provides monochrome screen support (the resolution is adjustable--Thanks to Hauke Hess for this driver) along with support of 24-pin epson and deskjet printers. In GS 2.1.1, every device had a separate executable (very ugly). If you want some other standard GS driver included, email me before this weekend. GS 2.2 also takes backslashes in filenames. GS 2.1.1 is known to run on STs, at least one TT, and to correctly process ouptut from dvips, gnuplot, and gem2ps. I expect the same from 2.2.

In case you can't wait for 2.2, here is where 2.1.1 resides at atari.archive. I expect that the 2.2 distribution will replace these files.

/atari/printing/gsprev.zoo This is GS2.1.1 with Hauke Hess's
screen driver as the only device.
This is in the wrong directory.

/atari/gnustuff/tos/ghstscrpt/ghscrptb.zoo This archive contains
the 2.1.1 binaries. It
is rather large because
it contains seperate
binaries for three
printer devices. In 2.2,
all devices will be in a
single executable.

/atari/ghustuff/tos/ghstscrpt/ghscrpts.zoo The GS2.1.1 source. You
need GCC 1.39 to compile
this.

There are also some fonts in /atari/ghustuff/tos/ghstscrpt. I assume that they are for 2.1.1. I am unsure at the moment about the compatibility between 2.1.1 and 2.2 fonts.

Source record: 230294

Hello,

all the problems you described occure also on my MEGA STe,
but have you also the following one:

If cache is on, blitter off, and external harddisk connected,
pixels occure on the screen, when I am on the desktop. I get
them when I goto the menuline and leave it. It seames as a byte
was written on the screen, cause it`s about 8 pixels. They are
in the upper left corner.

My dealer said, an explanation could be,that you should
have blitter off, when cache is on. He said this is written
in the newest Atari manuals you buy with the machine.
Is this right?
By the way, his opinion to all these errors was,
" THIS IS ATARI LIVE ".

See you later, Christian.

Yes I have noticed the computers but only on the video version. While
sitting on the bridge in front of La Defense i have seen nothing on the
scene. I have also seen 5 pages in the magazine edited by Atari France on
the installation used by Jarre during the show.

Poor music but great multimedia show!

1384. Accelerators for the ST forsale

Newsgroup: comp.sys.atari.st
Date: 1991-07-17 23:14:33 UTC
From: stevef@bug.UUCP
Message-ID: <742@bug.UUCP>
Source record: 230226
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

I have come to possess a large number of Processor Accelerators for the 520, 1040, and Mega ST that I will sell for $65 each shipping included. I will sell two for $100. These are new units, in the box, were built by CMI and are fully tested. These accelerators are on multilayer boards that plug into a socket you solder onto the 68000. These boards are built around a 16 MHz 68000 and run at double the standard processor speed. The speed up you get with this product depends on the software you are running, but it runs from 10 to 30%.

These boards (there is a different one for the 520/Mega or 1040, so let me know what you want) also accept 68881 floating point unit of any speed, although it doesn't pay to get one faster than 16 MHz. For software that uses the math chip you can get speed ups of eight to ten times or more.

There is also a socket for an Atari blitter chip if your machine didn't come with one. You can get these from your Atari dealer.

These boards originally sold for around $300. Schematics and PAL equations are available on request. Complete instructions are included. DON'T try to install one of these if you are not handy with a soldering iron and haven't done this kind of thing before! I will not be liable for your mistakes.

If you want one of these, call or send a check to:

1386. Need real word processor.

Newsgroup: comp.sys.atari.st
Date: 1991-07-18 01:14:42 UTC
From: bremner@cs.sfu.ca
Message-ID: <1991Jul18.011442.6798@cs.sfu.ca>
Source record: 230216

I had been following the Calamus vs. Pagestream flamefest with interest, because I thought this might be what I was after. After trying Pagestream out, I don't think so (even ignoring the fact that it, version 1.8, crashed twice within an hour).

Here are the constraints

1) PostScript output

2) Some graphics/layout ability; i.e. need to import diagrams.

3) Usable as a word processor

Now Pagestream (or a more stable version thereof) would fulfill items one and two easily, but I don't think I could stand to watch the line I'm typing flicker for long periods of time.

Essentially what I'm looking for is a high end word processor, I don't need to flow text around graphics or fancy stuff. It doesn't seem to me that Wordperfect has the wherewithal.

A couple of options already considered and rejected:

1) LaTeX; I don't mind it, but S.O. hates it. Is there a colour dvi previewer?
2) Spectre; this seems expensive, especially with buying a monochrome monitor.

Any suggestions?

Mail is great, I will summarize

From: rjast1@unix.cis.pitt.edu
Message-ID: <153144@unix.cis.pitt.edu>
Source record: 230212

For Sale: Supercharger IBM emulator for Atari ST (and TT), external connection (no soldering!), uses Atari's monitor-disk drives-harddisk-etc, NEC V30 chip (like 286 without protected mode) at 8mhz, math coprocessor slot, can run concurrently with ST side, can launch IBM programs from ST's desktop, use ST's mouse as a Microsoft-compatible mouse, runs most programs I've tried (Turbo C++, Smalltalk/V, James Bond, Jeopardy,etc -- these programs not included), comes with DOS 4.01 (with DOSSHELL), excellent for students - run your IBM programs for class on your Atari, etc. Windows 3.0 is supposed to work on it.

Software version 1.4 (newest)...

Oh, has its own 1 meg RAM (so anyone from 512k to 4 meg can use it!)

Price: $300, comes in original box, cables, DOS 4.01.

If interested, please leave me e-mail (rjast1@unix.cis.pitt.edu)
Thanks...

Robert Anisko

It sure does work. If your ST doesn't have an RF modulator built-in this
was made for you. However, as most people know TVs aren't as good
resolution as monitors and using med. rez on my TV at least is nearly
impossible. I guess it depends on your TV. Low rez is OK though.

1390. Elvis for MiNT

Newsgroup: comp.sys.atari.st
Date: 1991-07-18 09:53:47 UTC
From: hess@rospc1.informatik.uni-hamburg.de
Message-ID: <hess.679830827@rospc1>
Source record: 230215

Hello,

I just got Elvis, a wonderfull vi clone that even supports the abbr and
a tag command. Really nice, isn`t it. That`s what I thought, until I tested
it under mgr. It didn`t work. Then just pure MiNT with the simple shell.
It didn`t work too! It just doesn`t do anything. doesn`t build up a screen nor
accept any keystrokes (that`s what it did in mgr too).

Who could tell me that this isn`t true (or tell me, how to do it better)?

My second question is: why does elvis doesn`t do well on german keyboards?
The umlauts work fine, but []{}\@ get unreachable, until I remap them, so
the umlauts get a problem. And finally the []\ keys are unable to recognize
both alt and shift key, so that remapping []{} to the original alt-shift
sequences is also impossible.

Hauke Hess / University Hamburg / Germany

1391. NEW NEW NEW MEGA STE problem?

Newsgroup: comp.sys.atari.st
Date: 1991-07-18 11:35:41 UTC
From: johnj@echo.philips.nl
Message-ID: <1991Jul18.113541.22113@echo.philips.nl>
Source record: 230227

I'm almost sorry to post another problem with my MEGA STE
to the net again, as my previous ones got so many responses.

However, here it is:

My MEGA STE (I mean TOS) sometimes cannot find its floppy drives!

My working room is at the attic of my house (In case that
my English is not right, I mean on the highest floor).

Sometimes it happens to be a little hot there,
but with a big fan around it's just ok.
Temperature sometimes rose uptill 30 degrees (CELSIUS) last week,
and together with the humidity of our area if felt quit hot.

For 5 years I worked with my ATARI 520 ST (upgraded to 1MB)
and a lot of keyboards MIDIed to them there and never had
any problems (even at higher temperatures).

Since two months I am a proud-) owner of a MEGA STE having 2MB
RAM wishing it was my previous 520 ST!
Besides the screen problems (which *IS* a application failure
according Atari here in the NETHERLANDS as I reported earlier),
I now also have the floppy drives problem.

There is one advantage-):
Booting without a floppy disk in the drive leads to the
floppy light going off, even without the killdrv.prg.

I could work with my harddisk ofcourse, but after sometime
(less than an half hour I think) bombs arise on the screen,
and rebooting is not even possible anylonger.

Any comments anyone?

Could you please state what extractor you used? It is of no use to say anything against the .LZH-Format if you don't give us any hints what program you used. There are many different versions of LHarc available, some of them are incompatible with others. Perhaps the file was packed with lha2.00a, this is using a totaly different method (it is like a brand new archiver, only it is compatible with older versions).

From: CSULLOGG@CRL.AECL.CA
Message-ID: <31300@know.pws.bull.com>
Source record: 230217

Two questions:

First, is there any way to connect a Star Gemini Printer (with a Commodore 64 interface) to an Atari ST?

Second, a local PC user blew away his son's hard disk (software wise) and wants to do a low-level format, etc. He does not know which HD driver to select from his installer option. He has a Western Digital HD with the number WD 93044-A on it (serial # 028637). What drive(s) is this equivalent to (# of heads, # cylinders, etc). Thanks.

Finally, I have had very limited success with posting question of a techincal nature. The moderator for info_a16 seems to like posting endless messages about 'the man with the pipe' and 'terminator 2' appearences of the Portfolio. However question, like anyone have checkers for the TT, to get my postings in the digests?

>
> It should at least not be allowed to overheat. 20 MHz from a 16 MHz part can
> be reliable, but only under the right conditions.

For what its worth: i have been running the 20Mhz part in my (1040/4M) St for over two months. I never switch it off, and it has been pretty darn warm here boston this summer. No problems so far.

Note: this accelerator (and all other ones i have ever heard of), talk to the St hardware at the rated bus speed, so i doubt if rest of the hardware really care what speed the processor runs at, as long as the interface specs are met.

The only problems i have heard about are flakeyness due to additional loads on various signals. There are well advertised and documented workarounds for those. The biggest hardware bug is atari's puny power supply. i replaced mine with a heaftier one.

cheers,

Source record: 230209

Funny people, some Amiga owners

Last night we had a careers evening here and gave
some tours to prospective students. In my part of the tour we
showed our Apollo network and our Silicon Graphics 4D35
2048x1024 GT 56 plane Z buffered 3d Graphics system. One 15 Y-o
decided to tell me that his Amiga could do that !!!!

Granted, I like my Machine at home but I would *NEVER* Pit
it against A 4d35 even if it were a TT (040 model) SGI is just the
ants pants when it comes to graphics.

Tis ever amusing...

PS for the Die-hard Amiga readers out there reading this, Please
NOTE I am posting this to Comp.sys.ATARI.ST not Amiga.advocacy
so please flame by email. This item was intended ONLY for ST owners
flame-wars and credit cards will not be accepted

1400. Re: Problem w/ TeX 3.1 at atari.archive (was Re: getting TeX up and running on your ST)

Newsgroup: comp.sys.atari.st
Date: 1991-07-18 16:32:38 UTC
From: ralph@laas.fr
Message-ID: <RALPH.91Jul18183238@orion.laas.fr>
Source record: 230090
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have uploaded to atari.archive a corrected version of BibTeX
compatible with the new TeX 3.1 distribution. Credit goes, of course,
to Frank Ridderbusch for recompiling it! The difference is that it
accepts a TEXINPUTS environment variable compatible with TeX 3.1/LaTeX:

setenv TEXINPUTS '.\acm;.;e:\tex\inputs\local;e:\tex\inputs'

Dont forget that in both versions your *.bib files are looked for in
the BIBINPUTS path environment variable analogous to TEXINPUTS.

Cheers,

In article <1991Jul15.163633.26800@ux1.cso.uiuc.edu> timothyg@ncsa.uiuc.edu (Timothy Gallivan) writes:
| 4) A graphical interface to one of the PD debuggers would also be nice,
| something like dbxtool on Suns. One window has the source
| listing with an arrow pointing to the current line. Break points
| can be selected with the mouse, etc. By the way, do any of
| the commercial C packages have anything like this?

That would already be decent! But why can't we get a decent debugger environment (even on a Sun)? I mean to have something under X11 as ergonomic as some of those old Lisp Machine debuggers were. I would just love to have something as usable as Xerox's Interlisp debugger front-end; that alone would reduce debugging time by at least 50%.

Maybe this is all wishful thinking...

>$49. Has anyone had any experience with this version?
>Does anyone know what is included in the package? (New manual, compiler,
>etc.)?

I just got my copy (it's 3.6). For the upgrade price you only get a
few manual pages with the Matrix commands documented. It does include
both the interpreter and the compiler.

>There is also an offer for an MS-DOS version. They claim that programs
>are portable, but I don't know what that means exactly.

The MS-DOS version (which I also received) is an expanded version of
the ST version. Since both versions allow rather low level messing
with their hosts, there is no real way to insure that programs are
universal across all machines. But if you stick to the higher level
type commands (including the higher level graphical interfaces) you
should be able to write code that is mostly transportable.

The MS-DOS version (versions actually) comes on four disks. There
is the one for chips up to the 286 and one for chips up to the
486. They also have versions which incorporate the co-processor
chips in both of the above versions -- four variations, one per
disk.

There are two manuals, one is a command reference and one is a
user's manual. The compiler will be shipped to all purchasers
when it is complete. In the meantime, they again provide the
run-only version for distribution to anyone.

Since they now bundle the compiler with the interpreter in the ST
version, they have dropped the ST run-only version.

They claim to be working on a Unix version. I will buy that when
it comes out, too.

1406. Questions about Mega STE

Newsgroup: comp.sys.atari.st
Date: 1991-07-19 00:50:59 UTC
From: tdrga@ccwf.cc.utexas.edu
Message-ID: <52549@ut-emx.uucp>
Source record: 230229

I am planning to upgrade from my 1040STF to a Mega STE soon. In order to make the final decision, I would like to solicit some feedback from current owners or users of Mega STE's.

My main interests are CADD, Word processing and DTP, image rendering, terminal emulation, and programming. (In roughly that order.)

I have some specific questions listed below, but I will gladly accept any comments.

Questions:

1. Compatibility with current ST software - any commercial programs in the above areas of interest which do not work?
2. Ability and ease of upgrding RAM - user installable SIMM's? Maximum memory?
3. Keyboard - I have seen references to an inferior keyboard (i.e. not the same as the TT's). Any possibility of getting a better (TT) keyboard?
4. VME Bus card - what is this? Is it a useful thing?
5. Monitor compatibility - Same as ST?
6. How effective is the 16Mhz at speeding up things?
7. Is a FPU available and easy to install?
8. How about this DMA problem that everyone is having? Will it be fixed? Is it present in all Mega STE's or a few?
9. Is this machine a good value? The lowest prices I have heard are $899 for 1M RAM/40 M HD CPU only and $1199 for 4M RAM/40M HD CPU only. Are these prices coming down?
10. When will these machines be available? Nobody I called had 1M machines in stock.

I realize that I'm asking a lot of questions, but I'm not sure what the Mega STE's have to offer, and I have no other source of information (no magazines to read!), so I'm asking for a little help in making this decision.

I intend to remain an Atari owner, and would like to make an informed choice.

Please e-mail all responses to me personally, since my situation is of limited interest to the entire net community. If I am requested to, I will post some of the info I get.

Thank you,

Todd Drga

1409. Voice Recognition Units

Newsgroup: comp.sys.atari.st
Date: 1991-07-19 09:01:59 UTC
From: s883334@minyos.xx.rmit.oz.au
Message-ID: <1991Jul19.090159.8473@minyos.xx.rmit.oz.au>
Source record: 230241

I noted with great interest a voice recognition package for the Amiga that seems to have been out for a while, its called VoRecOne, by Impulse. It connects to the amiga via its joystick port. I assumed this would have been done with portability to other computers in mind since it would make it fairly easy. The actual software is very good, allow script files to be set up and activated by certain key words. It simulates mouse and keyboard entry via the scripts as required.
Is there anything like this for the atari ? Perhaps this package is available for the atari ? If so anyone know where I can get it and an approx price ? (The amiga one was $117 from a firm called Computability in USA)

- James.

Not quite, It was recomended as the best Word Processing system in
the low end price range. The exact Spec was 1040STe with mono monitor
and 9pin printer running First word Plus.

I wonder what they would have made of some of the better WP packages
such as Thats Write or Caligrapher?

BTW the report I read was in Micro Mart (or it may have been Computer Shoper.)

If I remember correctly these boards don't use and caching so the speedup is
very little since every time the CPU requires data or a new instruction the CPU
has to do this at 8Mhz. The hypercach board, Mega STE and new ICD boards etc.
get around this problem by using a fast cach on the accelerator board.

Message-ID: <1991Jul19.131338.18428@actrix.gen.nz>
Source record: 230236

Is there a working version of Ultra disk packer on atari.archive,
the one that is/was there Version 1.1 , does not work.

I have uploaded the STE_SND Demo to a BBS, and now find that
no one can uppack it, this is because that Version 1.0 of
Ultra was deleted from my System and From this BBS..

The Problem with Ultra V1.1, it will not format disks,
or unpack, comes up with negative numbers for sectors
and only 7 tracks, it did seem to pack ?, but can't test
this.

About the Spectre Hard Drive backups. I've found that with real MAC disks (with
the GCR of course), virtually all the MAC hard drive backup programs work
properly. If you use Spectre format disks, they will work as long as the disk
has just been freshly formatted, but the next time it will set the disk to
400K. This has happened with every Mac HD backup program I have tried. So far
they have all worked just fine with MAC format disks however.

1416. Re: TT compatability...

1420. Re: Video Key

Newsgroup: comp.sys.atari.st
Date: 1991-07-19 18:33:57 UTC
From: lch3e@holmes.acc.Virginia.EDU
Message-ID: <1991Jul19.183357.5501@murdoch.acc.Virginia.EDU>
Source record: 230245
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

My neighbor had a VideoKey so their kids could play games on the TV. It works well, tho not any better than the rf port on the 520 (they claim it looks better since it's straight composite-output, but it didnt't to us).

80 column text on a tv is legible for the most part, but some letters are confusing/hard to read. It is, tho, the ONLY computer I've EVER seen that is at all useable in 80 col. on a tv. They designed the pixels in med. res. shapedlike a vertical rectangle (the monolith!). On a tv it's readable, and on the Atari's CGA-pixel color monitor, the text looks as good as EGA on a PC. THat's a big reason why I prefer it over the Amiga, too.

Anyway, the VK got zapped by lightning. With a new one costing $80, they decided to invest the $$ in a used color monitor instead.

ATARI ST: The best computer for poor people!

You don't seem to understand how Multi-tasking on the Amiga works then. (now
don't flame me people, again, i'm just pointint out errors) The Amiga's
hardware is more than just the 68000. it has a complex hardware interrupt
handler which divides the 7 68000 interupts into 15 for everything from
software interrupts to blitter interupts to serial intterupts to audio
interupts.. all kinds of things, then add int the Amiga's multi-pourpose
timers (8 of them) which are all capable of generating interupts for timed
real-time applications. a complex interupt structure is a MUST for *DECENT*
multi-tasking.

1423. DC Clock

Newsgroup: comp.sys.atari.st
Date: 1991-07-19 19:29:09 UTC
From: malay@sae.com
Message-ID: <1991Jul19.192909.1799@sae.com>
Source record: 230244

When I try to use DC Clock (dcclk33.arc from a.a) set up as a DA I get two bombs. The ".prg" file runs fine from the auto folder or from the desktop - only the DA file gives the bombs.

System:4MB 1040STe, auto folder contains poolfix, ste_fix, and maccel3

I've tried it on a new disk with only one file (the clock DA) in the auto folder and get the same result.

Whats wrong?

From: rcb@netcom.COM
Message-ID: <1991Jul20.012520.3171@netcom.COM>
Source record: 230151

I grabbed GNU make 3.59 off of atari.archive in
gnustuff/tos/othergnu/make359.ttp. It seems to improve the make 3.54
I was using before in that, on large make's, I would not get the
"System halted. Out of memory - use foldrxxx to get more" message as
often. On the down side, I must now specify the absolute path,
including extension, for every external command in my makefiles. It's
a pretty serious drawback! Does anyone know of a work-around or
another version by which I can get the benefits of the PATH
environment variable? If it helps, I am using Gulam as my shell with
'env_style' set to 'mw'.

I agree with this. Sure that ST's OS does not take full advantage of the
hardware & doesn't do a few of the pretty things the Amiga does but its
still a decent bit of hardware to build an OS around.
The ST has a few of the more standard controllers on board. Amiga has
custom chips. There are advantages to having standard controllers
around eg decent floppy IO. PC/STs floppy disk access is faster than
the Amigas. Its probably possible to get the Amiga's speed upto or above
the ST's with a custom track loader but for general file usage the ST's
is nicer.

Excuse me! What a lot of crap.

I suppose what you're talking about is the 68000 Minix fork() hack.
You can't blame that on Minix. The 68000 is the cow. A 68020/MMU
or 68030 would cleanly perform the job. Anything up from an 80286
(I think) can cleanly perform the job as well.

The fork() hack involves physically swapping (copying) data/bss areas
on task state transitions. Fortunately the first thing you do after
a fork() is an exec() so all is ok. BUT with programs like kermit
that set a receive and send process it gets AWFULLY slow. When
processes are forked like this (shadowed), the swaps are slowed. IE
shadowed processes get a longer quanta.

>>
>>There are things you need in order to manage multi-tasking; a restartable
>>instruction stream helps a lot, as does a sensible interrupt system. The
>>68000 is (just about) suitable.

Finding such an expansion for my Amiga 1000 is nigh impossible. The
Lucas board is no longer being made. Plenty are around for 500/2000s.

> Or a 2500, or a 2000 with and accelerator, or a 500 with an excellerator, or a

> 020, 010. and an 010 is the lowest processor you need to have an MMU.

Using an MMU with the 68010 is a real dog. The MMU will function on the
16-bit bus of the 68010 but you can't use MMU instructions but have to
simulate the coprocessor interface and talk to it with MOVES instructions
to access CPU space (thanks Michael). YUK.

But how will the backup disks look like? Will they be some form of
image dump of the partition, or will they be ordinary Spectre disks
with ordinary Mac files? The latter would be nice, as one could say,
backup from an ST and restore on a Mac.

This is exactly correct. Best example: running OS-9 on the ST.

chucks@pnet51.orb.mn.org (Erik Funkenbusch) replied:
>You don't seem to understand how Multi-tasking on the Amiga works then.
>(now don't flame me people, again, i'm just pointing out errors) The Amiga's
>hardware is more than just the 68000. it has a complex hardware interrupt
>handler which divides the 7 68000 interupts into 15 for everything from

Suggestion: Learn much more about hardware, and both systems, before posting!

First, you've confused a master interrupt enable register with actual sources.
There are more than 15 possible interrupt sources on the Amiga.

Second, there are also more than 15 sources on the ST. And not so oddly,
both systems are very similar as to what those are (disk, timers, etc).

The only real difference is that the Amiga interrupts are divided amongst
six 68000 levels; whereas the ST divides them amongst three, with about a
dozen of the sources prioritized into one. - kevin <kdarling@catt.ncsu.edu>

1436. Another problem with MEGA STE

Newsgroup: comp.sys.atari.st
Date: 1991-07-21 10:51:44 UTC
From: wieninge@uhura.uni-passau.de
Message-ID: <1991Jul21.105144.10033@forwiss.uni-passau.de>
Source record: 230157

Hello out there,

to the increasing list of errors and problems with the new atari machine
MEGA STE I have (unfortunately!) to add a new one:

A friend of mine has problems to run the SPECTRE GCR 3.0 mac-emulator.
All works fine if there is cache off. When switching cache on it's not easy
to get the emulator running. In almost every case, SPECTRE termitates
while booting the mac. Once the mac-desktop appears all works well, only
one program (stuffit deluxe) refuses to work with cache. It costs about
2 or 3 trials to get the mac on the screen. On the normal MEGA ST there
are no problems.

Has anybody an idea, what could be an explanation for this?
Sure the problem could also be the emulator, but as Allan Pratt said,
there are no differences between the new and the old one atari.

Atari still says this errors occure only on several machinens and
these ones should be sent back to the dealer to be fixed. This would
be the third machine I have to get fixed, and on the average this lasted
about 2 months for the first Atari machines I had.
So my question is, does Atari already know the error, and how long does it
last, to get the machine fixed. It would be very nice, if there was any
answer to this question, cause it's not a single problem.

Good luck for all to get their machines fixed,

Christian.

1438. CMI accelerators: a caveat

Newsgroup: comp.sys.atari.st
Date: 1991-07-21 15:54:55 UTC
From: pbh@jake.cc.wayne.edu
Message-ID: <1991Jul21.155455.2186@cs.wayne.edu>
Source record: 230186

A few days ago a distributor(?) posted a message about some CMI accelerators for sale. I have just posted an 80K arc'd file detailing peoples experiences and findings with these acceleraors, you'll find the file on atari.archive. Bascially, bonuses obtained with this device were rather dubious, but you can draw your own conclusions.

This is just my personal opinion from owning an ST for 6 years, but I think you'll find the least expensive accelerator that's some out for the Atari is TOS 1.4. If you own a hard drive the speed-ups are incredible. After this upgrade, save up your money, and get ICD's product or Jim Allens (Dave Small's SST isn't out yet, is it?). Really, you'll be a lot happier, and you'll be supporting our few and precious remaining developers. Put aside $25 per pay for 6 months, then get a proven product with a developer who will be around to support it. Even better, try supporting your local dealer and getting it installed through him.

Of course, if you're feeling adventurous, and you can afford to risk your ST, I say go for it. The ST is a hacker's beast, too, and $65 can get you an evening's full of home-hacking fun....

However, *if* you get it to work, *don't* expect to get performance out of it at the level of T16/20 or AdSpeed.

| The ST version lets you do something like 'zoo a// archive.zoo *'. The '//'
| in conjunction with the 'a' adds not only simple files but also directory
| trees to the archive. I would like to see that as a general feature in
| zoo.

That's not only present, but the default. I suggested it to Rahul and sent him the patches, and he agreed. The : option now disables saving the path on storage, and disables using the path on extract. And you can even use :/ to "use the subdirectory if present but don't create it," although that fell out of the code because it was a feature in 2.01.

I wanted it because every time I post something with subdirectories in c.b.i.p someone forgets to use the //.

I would also like to share some of my problems with my Spectre 3.0
Mega STE combination.

I seem to have reduced problems with System 6.0.4, when running the
Spectre, any other system will not work for some ungodly reason.

System 6.0.4, and my system in general is nowhere near as stable as it
was with my old 1040ST. At 16Mhz I notice the most speed improvement
under MultiFinder.

But with the Cache ON, in this way, things get unstable quickly.

So, my recommendations are to try System 6.0.4, at 16Mhz cache on I
found it the most stable...relatively anyway, to the other choices.

Its pretty good with FInder, so so with Multifinder, needless to say
I wouldn't use 16Mhz cache mode for any serious work for now at least.

8Mhz mode I still don't think its as stable as my old 1040ST, with my
1040ST I could go for days without crash pages, now barely an hour
goes by and my MEGA STE gives me a crash page.

Does Dave have a MEGA STE machine to work on? I hope so!

1441. Sozobon C HELP!

Newsgroup: comp.sys.atari.st
Date: 1991-07-21 17:44:52 UTC
From: aa400@cleveland.Freenet.Edu
Message-ID: <9107211744.AA11793@cwns10.INS.CWRU.Edu>
Source record: 230161

I am learning C from C-Manship complete, by Clayton Walnum... I am trying
to use the sozobon c compiler, but I am having a lot of trouble with it.

I have all binaries in sozobon/bin, all lib files in sozobon/lib, all
include files in sozobon/include... My C programs are in sozobon.

To compile a program, I use a pd CLI accessory, because I can't get anything
to work from the desktop.. (Parameters..) Anyway, if I simply type the
filename of the C program I want compiled with cc.ttp by

cc.ttp program.c

I get a "File suffix:"program.c" not known....

I did get it to compile SOME programs by simply placing a quote in front
of the filename, by cc.ttp "program.c

The problem is, for some reason the compiler doesn't recognize some functions,
even though I remember to include the header file... for example, if
I #include <stdio.h> and #include <osbind.h> I get an undef _Random and
undef _abs.... (I am using the functions in the program..)

I checked through the osbind header file, and Random is definitely defined
as xbios(17).. I am not sure about abs, so I went ahead and included
math.h, but that didn't work either! Sozobon C has to be more complete
than that... I know it is!

Please tell me what I am doing wrong... I am not used to using a cli, but
I have no idea how to use cc.ttp with the desktop thing...

Thanks in advance.

It wouldnt work on any atari other then the 8bit computers..
You see, the 8bit and the amiga use bidirrectional joystick ports...
(Remember seeing parallel ports working off the 8bits joystick ports
as cheap printer ports?)
The only way to really do it is make a special interface for the cartrige
port... Use the printer port (which is bidirrectional on the ST..)
Or get a 1040Ste and use its new joystick ports...
(Although since they are not on the new megaste or tt you might be
wasting your time with the extra joystick ports..)

Actually the slow speed of the floppies is mostly related to the file
system used. OS 2.0 supports formatting of floppies under the FastFileSystem,
which brings about a twofold speed increase.
The main problem with the hardware that handles Ami drives is that it can't
handle the 500K/sec transfer speeds of high density floppies. The biggest
advantage to it is that while I'm formatting/loading/copying/whatever, the
whole system doesn't screech to an almost-halt (tried changing to a different
window the other day while Corel Draw was exporting clip art to a floppy...
on a 33MHz 386... it worked, but not until Corel finished completely
about 5 minutes later...).

I'm not too familiar with Minix, but I believe I've heard somewhere that
the 68K version tries to 'artificially' segment memory to retain similarity &
source compatibility with the PC version. This might be completely wrong,
but it is something I've heard...

This can already be done by a number of shareware and freeware prgs.
I think that elfboot will create a ramdisk and copy files to it as one
of its many functions. I use EDISK 2.1 to create the reset-proof
ramdisk then LOADRAM to copy a number of files (via a script) to the
ramdisk. LOADRAM will make folders and copy from any source (ie hard
drive or second floppy). Pretty handy combination.
Not to say that something new from DC wouldn't be welcome... :)

Actually, a ramdisk that worked like this would be wonderful. I know that it has been discussed here before and something about the way TOS was set up, or something else, prevented this type of ramdisk or spooler. But maybe someone figured out a creative way around this? (There's one for DC to tackle in a week).

It looks like you might have to set cache off, CPU 8 MHz before starting
Spectre and switch cache on, CPU 16 MHz after Macintosh has booted.
I seem to remember this was needed for Hypercache on an old ST as well.
It could be something to do with Spectre checking that the Mac ROMs are real
ones and not EPROMS, or it might be some other timing problem while Spectre
is initialising the Macintosh system. Either way it is more likely to be an
incompatibility with Spectre than with the STE. If it needs fixing then Spectre
should be changed for the STE / TT, not the other way round. Probably it is
just the Spectre software, not the hardware so it shouldn't be difficult for
Dave to fix if that is in fact the problem. I wouldn't be surprised if he's
already fixed it.

Weren't most of the original 16Mhz accelerators overclocked 12Mhz 68000s? Motorola (I thought) didn't start making 16Mhz versions of the chip until later. Even if the running of the 16Mhz 68000 at 20Mhz is questionable, It seems that the worst that could happen is your 68K burning out and being replaced Fast Technologies. And I doubt Fast Technologies would try to sell a haphazard accelerator. They do have a reputation to uphold.
Just my opinion.

Yes. Declare all of your major tools via macros:

```
CC = D:\bin\cc.ttp
LD = D:\bin\gnu\bin\gcc-ld.ttp
(etc.)
```

in a defaults file.

Then, either include that file:

```
include D:\lib\default.mk
```

```
blah: blah.c
$(CC) blah.c
```

or, MAYBE, call it default.mk in your $HOME directory (I'm not sure whether
that works) to have make include it automatically.

Ciao,
Warwick.

1450. NEW NEW MEGA STE problem?

Newsgroup: comp.sys.atari.st
Date: 1991-07-22 10:05:19 UTC
From: johnj@echo.philips.nl
Message-ID: <1991Jul22.100519.11721@echo.philips.nl>
Source record: 230176

Last Friday I posted the following:
>I'm almost sorry to post another problem with my MEGA STE
>to the net again, as my previous ones got so many responses.
>
>However, here it is:
>
>My MEGA STE (I mean TOS) sometimes cannot find its floppy drives!
>
>My working room is at the attic of my house (In case that
>my English is not right, I mean on the highest floor).
>And sometimes it happens to be a little hot there,
[..rest of posting deleted..]

I thought it had something to do with the heat, but
it happened last weekend again while temperatures
and humidity were quite normal in my working room
(21 degrees Celcius).

The exact message in the alert box shows:

"Drive A does not exist", when clicking on drive A.
(or "drive B...", when clicking on drive B).

After one or two cold-boots the drives are back again, and
the computer behaves with no problem at all.

I sometimes do boot the system without a floppy drive in the
drive and other times with a floppy in the drive. But up till
now-), I only had this, when starting with an empty drive.
But I'm not sure if this had anything to do with it.

Any comments anyone?

Source record: 230188
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

I must warn warn prospective buyers of these CMI accelerators. I had one, and it worked as advertised but it had one crucial side effect. I use the ICD SCSI host adaptor with my hard disk, and the CMI board caused random undetectable read errors (loading a picture would include some random pixels here and there). This made the board 100% unusable. For a floppy only system, this would be OK, but other than that, steer clear of the thing except for parts.

I have nothing against the seller, but I'd hate to see someone go through what I did.

I sent my board back to CMI, and they went bankrupt. I lost $300 to those bastards.

If you don't have a hard disk, or you want it for parts, $65 is a good deal... other than that, look into one of the others still supported.

My 2 bits worth.

HELP!, WHERE? HOW MUCH? Please let us all know EXACTLY where to find this program! An address/Phone#, internet address etc would be greatly appreciated! As for getting a good screen dump, get BIGSCRN.PRG, the original (I think) virtual screen imulator. Set BIGSCREEN to a really large size, and load the graphic into Calamus. The set the resolution to "printer 1 to 1 size". Then hit ALT-HELP. Bigscreen will write the entire screen to disk as an .IMG file. Since Calamus was set at printer 1 to 1 size. The graphic will be optomized to your printer reolution (set the graphic back to its original size in whatever software you use). Outline Art does not allow you to adjust the magnification to printer 1 to 1, so it does not work as well. Good luck!

>MEGA STE I have (unfortunately!) to add a new one:
>
>A friend of mine has problems to run the SPECTRE GCR 3.0 mac-emulator.
>All works fine if there is cache off. When switching cache on it's not easy
>to get the emulator running. In almost every case, SPECTRE termitates
>while booting the mac. Once the mac-desktop appears all works well, only
>one program (stuffit deluxe) refuses to work with cache. It costs about
>2 or 3 trials to get the mac on the screen. On the normal MEGA ST there
>are no problems.
>
>Has anybody an idea, what could be an explanation for this?
>Sure the problem could also be the emulator, but as Allan Pratt said,
